Expana

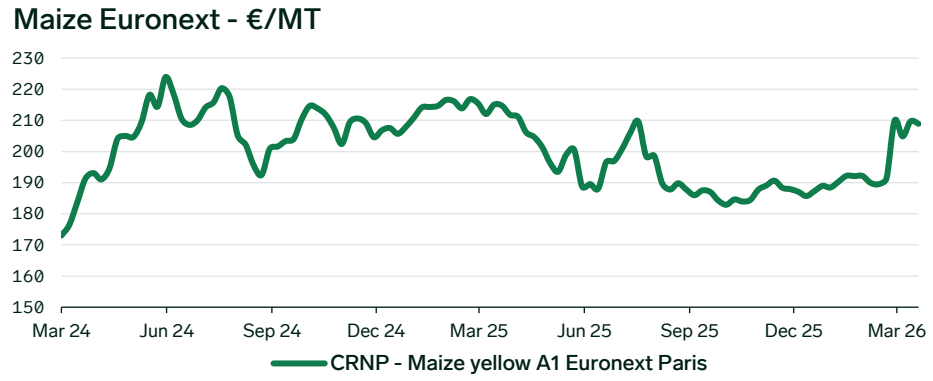
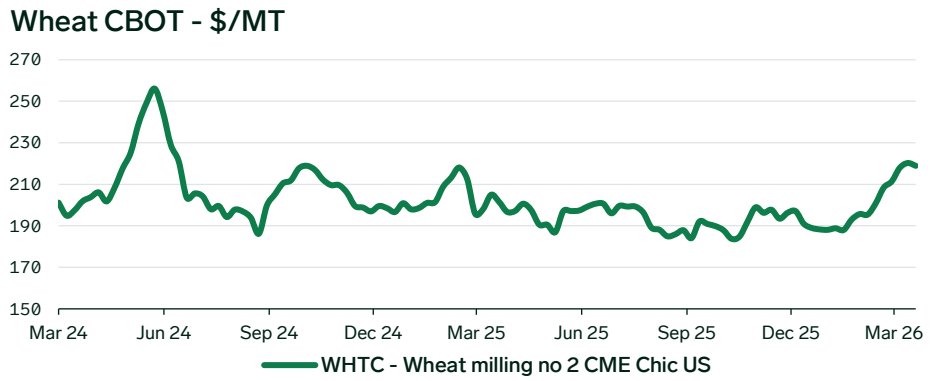
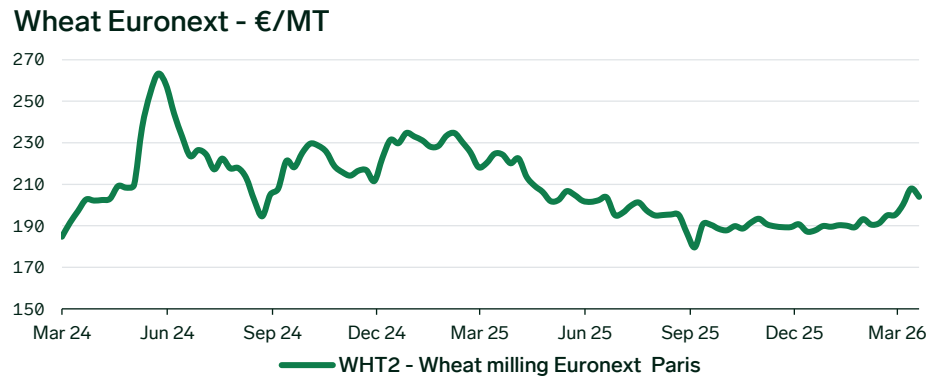
The average weekly price of CBOT Maize as of March 25 increased by 8.7% MOM and rose by 0.8% YOY to $182.97/MT. In March, global corn markets were shaped by a combination of input cost pressures and evolving acreage expectations, with fertiliser availability emerging as a central factor influencing both planting decisions and yield potential across key producing regions. In the US, corn prices continued to find underlying support from elevated fertiliser costs and uncertainty ahead of the upcoming USDA Plantings report. As spring planting begins, market participants are increasingly focused on how high input costs may alter farmer behaviour. There is a growing expectation of acreage switching towards soybeans, alongside the possibility of reduced fertiliser application rates.



The average weekly price of Euronext Maize as of March 25 increased by 9.1% MOM and declined by 2.7% YOY to €208.90/MT. In March, global corn markets were shaped by a combination of input cost pressures and evolving acreage expectations, with fertiliser availability emerging as a central factor influencing both planting decisions and yield potential across key producing regions. A similar dynamic is evident in Ukraine, where fertiliser affordability and availability are also constraining production prospects. Market participants indicate that while fertiliser supplies for winter crops remain relatively accessible, availability for spring crops, particularly corn, is more limited. Given that corn is typically the most fertiliser-sensitive crop, this imbalance raises concerns over both planted area expansion and yield potential.

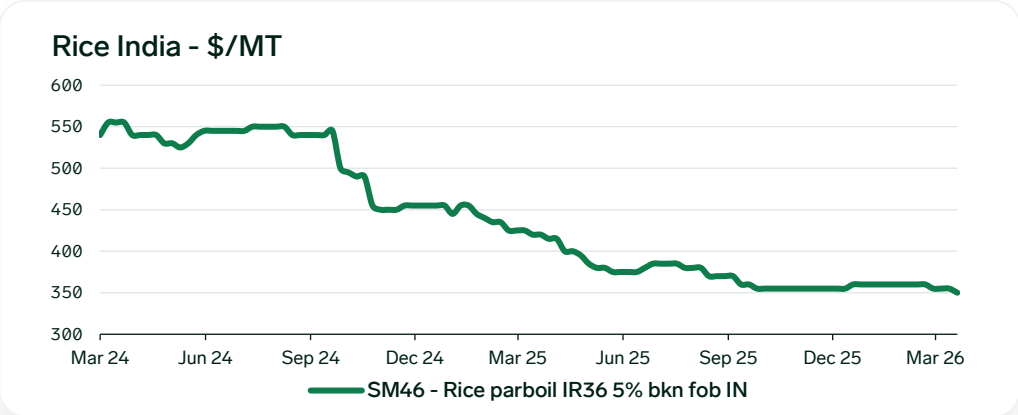


The average weekly price of CBOT Wheat as of March 25 increased by 5.0% MOM and rose by 8.6% YOY to $218.90/MT. A combination of geopolitical uncertainty and weather-driven supply concerns has shaped market sentiment across the grain complex in March. US wheat markets continue to derive support from deteriorating crop conditions. According to USDA data, at the end of March, only 46% of winter wheat in Kansas is rated in good or excellent conditions, down six percentage points week-on-week. Oklahoma conditions remain particularly poor, with just 14% rated in good or excellent condition, the lowest for this time of year since 2018. According to market players, persistently hot and dry weather across the Plains is expected to exacerbate crop stress, raising the risk of further deterioration.

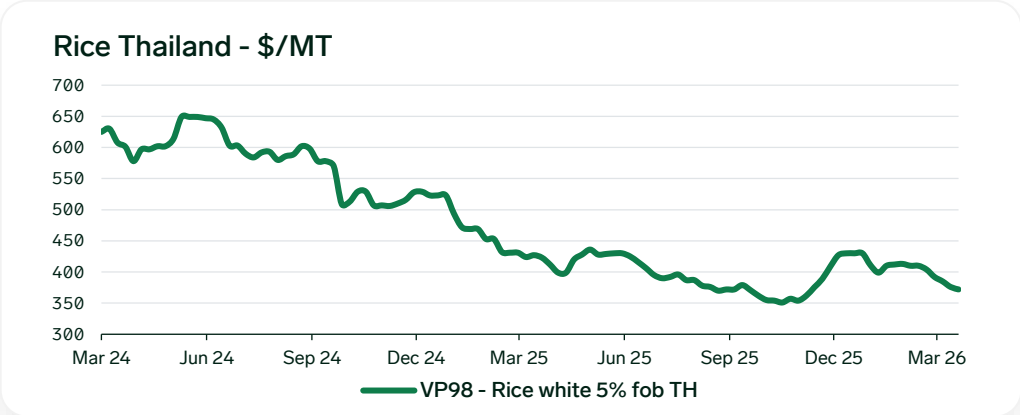


The average weekly price of Euronext Wheat as of March 25 increased by 4.6% MOM and declined by 9.1% YOY to €203.95/MT. Wheat markets experienced renewed volatility in March as geopolitical tensions in the Middle East and Eastern Europe continued to shape market sentiment, reinforcing underlying risk premiums across the global grain complex. From a crop perspective, Northern Hemisphere conditions remain broadly favourable, though risks are gradually emerging. In the EU, early-season conditions have been supportive, with above-average temperatures reported across western regions, including Germany and Denmark. Market players expect EU wheat production for the 2025/26 season to reach between 141 MMT and 144 MMT.

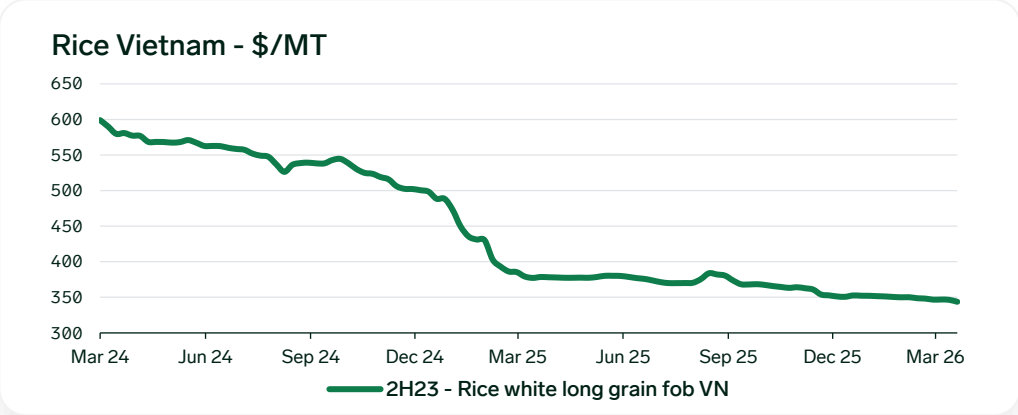
Rice



The average weekly price of Indian Rice as of March 25 decreased by 2.8% MOM and declined by 16.7% YOY to $350/MT. Market players stated that despite concerns of rising fuel and fertiliser costs, prices declined on stiff competition and strong supply prospects. As well as this, sources say that old crop stocks are record high, further weighing on prices.



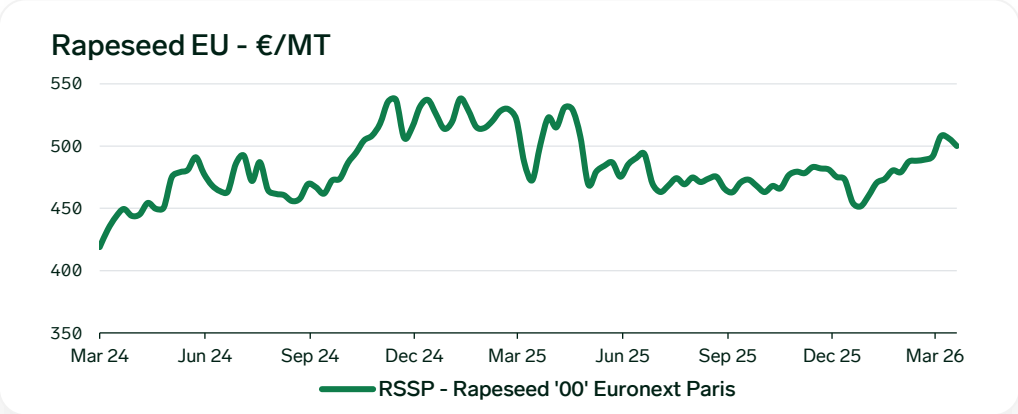
The average weekly price of Thai Rice as of March 25 decreased by 7.9% MOM and declined by 12.1% YOY to $372/MT. Following supply recoveries and an alleviation of policy driven concerns (previously supporting the Thai market), players commented that Thai rice prices have steeply corrected downwards.



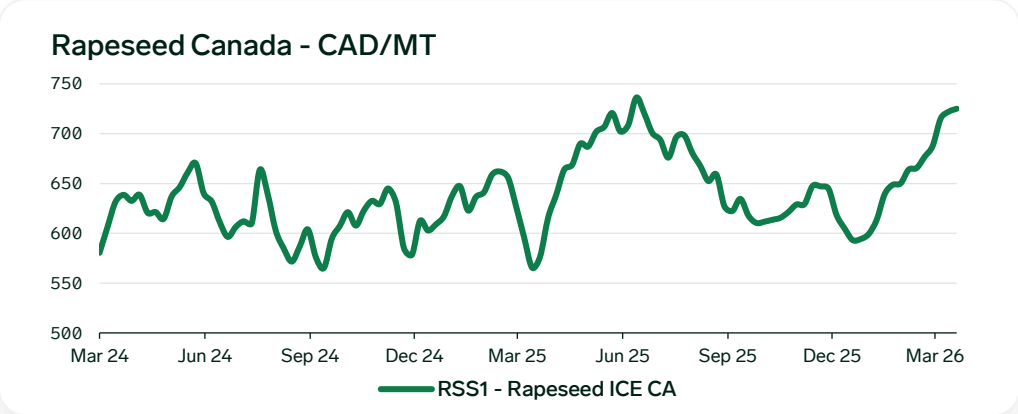
The average weekly price of Vietnamese Rice as of March 25 decreased by 1.3% MOM and declined by 9.2% YOY to $343.75/MT. Similarly to Indian FOB prices, market players noted that strong supply prospects in 2025/2026 have weigfhed on prices.

Oilseeds and Vegetable Oils

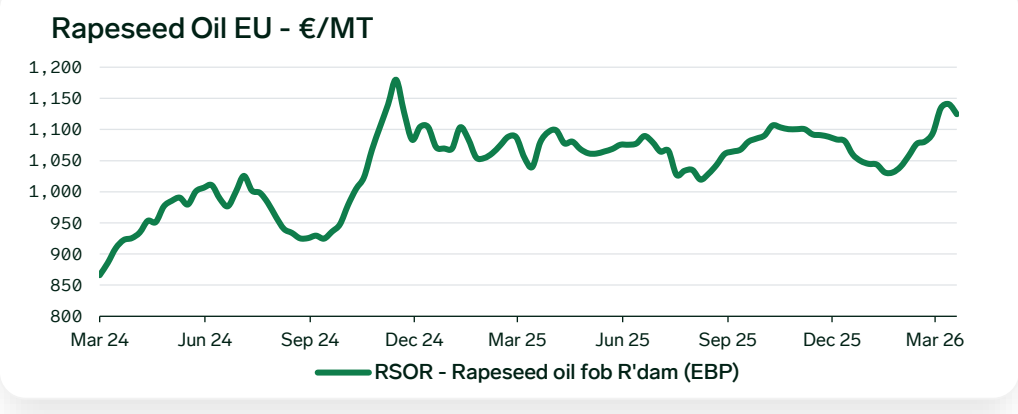
Rapeseed & Rapeseed Oil



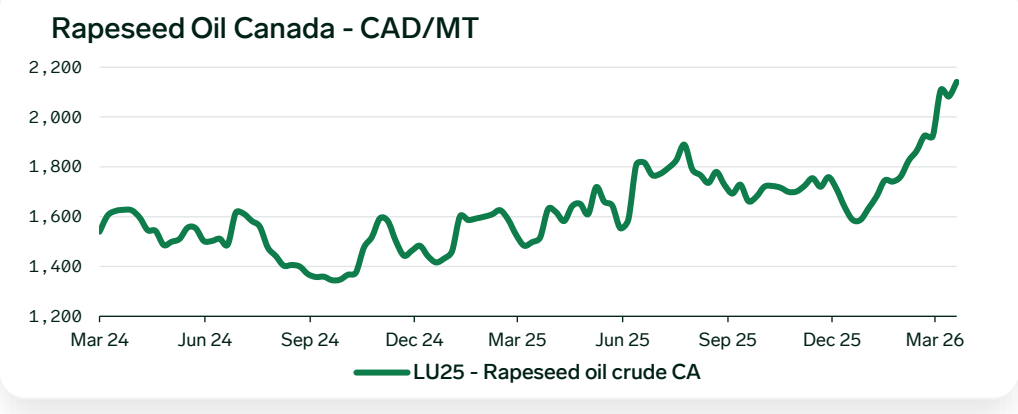
The average weekly price of EU Rapeseed as of March 25 increased by 2.2% MOM and declined by 0.2% YOY to €500.05/MT. Rapeseed producers are expressing concerns about production in 2026, particularly surrounding dryness Impacting north-eastern producers. COCERAL trimmed their EU-27 crop forecast to 21.1 million mt, supporting wider concerns in the market.



The average weekly price of Canadian Rapeseed as of March 25 increased by 7.1% MOM and rose by 25.7% YOY to CAD 725/MT. Industry participants are attributing price increases for Canadian Rapeseed towards limited farmer selling, that has weighed on exportable supply in the short term. Sources added that Canadian canola exports are down by 23.6% year-to-date

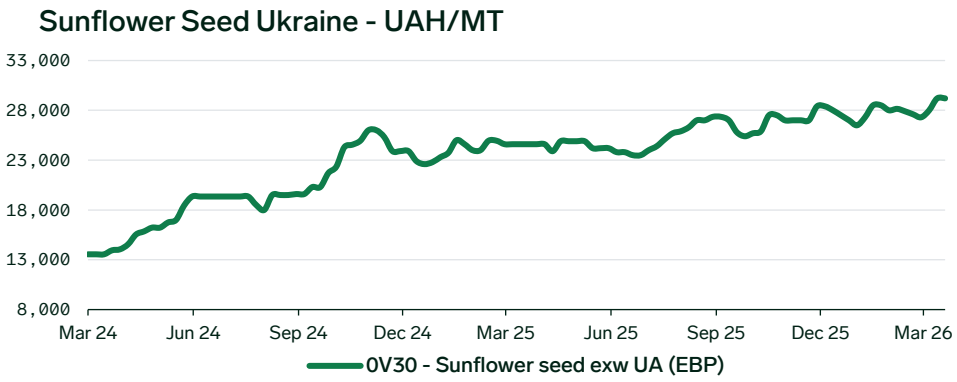


The average weekly price of EU Rapeseed Oil as of March 25 increased by 4.1% MOM and rose by 4.2% YOY to €1,124.50/MT. Market players told Expana crude oil rallies supported the entire vegetable oil complex. However, traders said that EU price gains in rapeseed oil specifically were limited by EU regulations, as 7% caps on blending artificially limits demand, putting rapeseed oil at a structural disadvantage.

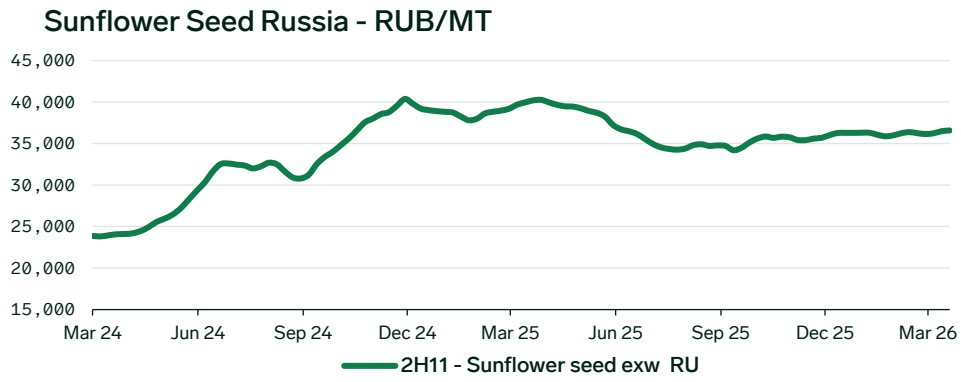


The average weekly price of Canadian Rapeseed Oil as of March 25 increased by 11.2% MOM and rose by 41.2% YOY to CAD 2,141.39/MT. Strong upward price trajectory in Canadian Rapeseed oil has been attributed both towards rising crude oil prices as a result of the conflict in the middle east, as well as lower availability of seed for processing.

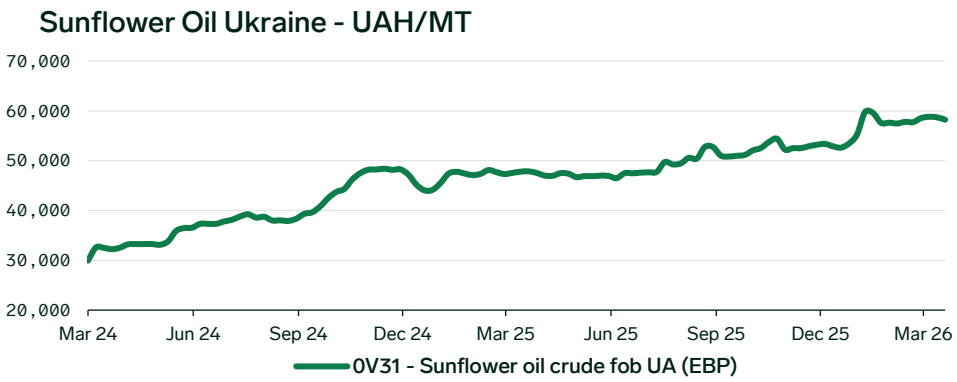
Expana © 2026



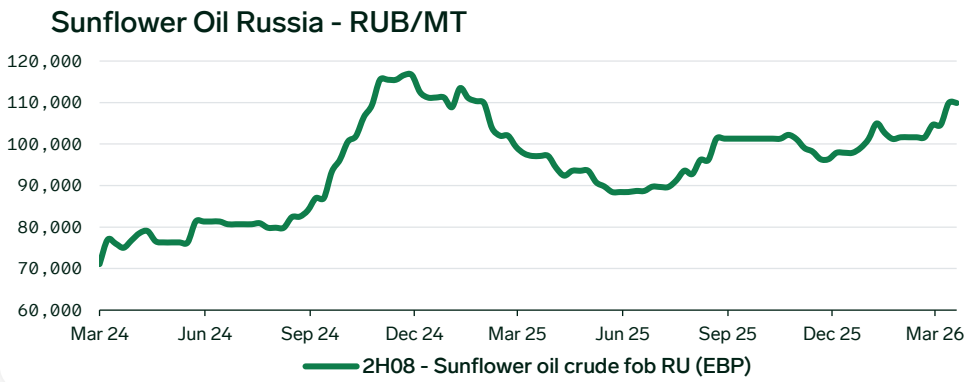
The average weekly price of Ukrainian Sunflower Seed as of March 25 increased by 5.8% MOM and rose by 18.7% YOY to UAH 29,200/MT. Market sources expect demand for seed to rise amid much lower than usual processing activity in Ukraine, which has primarily been due to conflict escalations and attacks on plants. This has in turn, supported prices.



The average weekly price of Russian Sunflower Seed as of March 25 increased by 0.9% MOM and declined by 9.0% YOY to RUB 36,575/MT. Industry sources told Expana that Russian sunflower production estimates remain subject to considerable uncertainty, with market participants continuing to question USDA's 17.0 million tonne figure following earlier season expectations of 18 million tonnes that players were predicting. However, traders expressed skepticism about even the revised 17 million mt figure, with sources suggesting that actual Russian production could potentially be even lower than current estimates, emphasizing that harvest realities may not align with official projections despite substantial levels appearing on paper



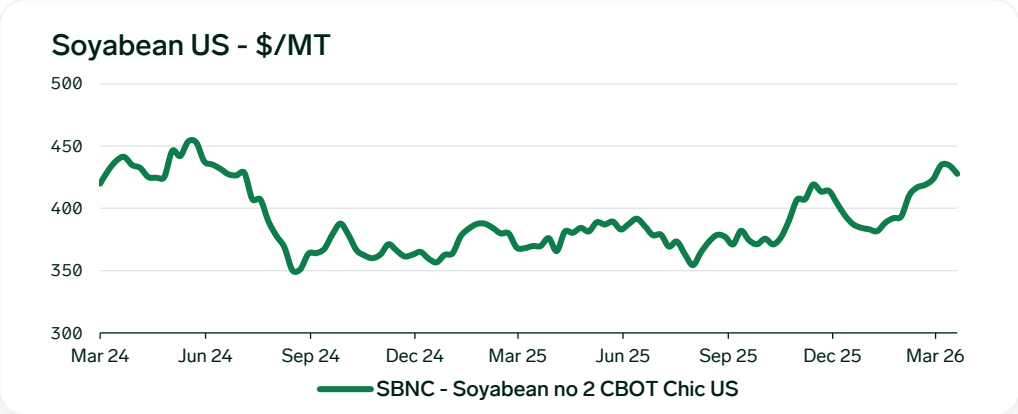
The average weekly price of Ukrainian Sunflower Oil as of March 25 increased by 0.8% MOM and rose by 21.7% YOY to UAH 58,226.22/MT. Sources said that Ukraine's sunflower oil processing is at its lowest in a decade, heightening supply concerns and lending support to prices. Production declines could be up to 10% year-on-year.



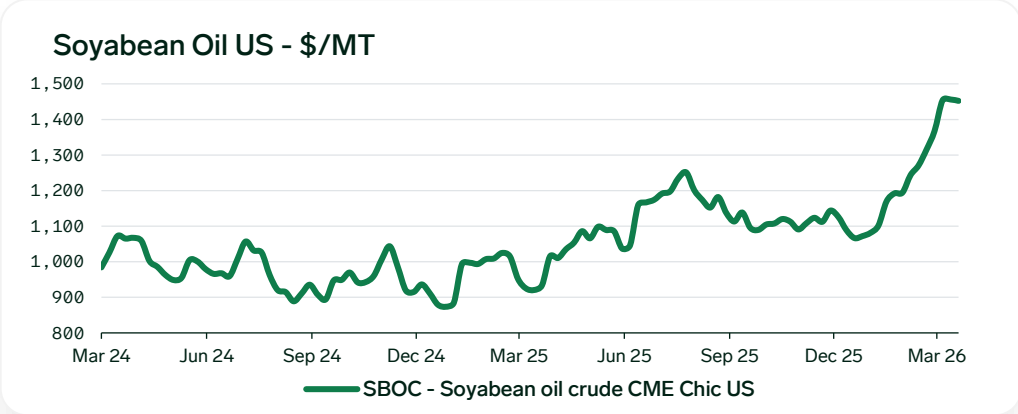
The average weekly price of Russian Sunflower Oil as of March 25 increased by 8.1% MOM and rose by 13.1% YOY to RUB 109,891/MT. Market players noted that processors are struggling with logistical constraints due to diesel shortages affecting transportation and crushing operations.

Oilseeds and Vegetable Oils

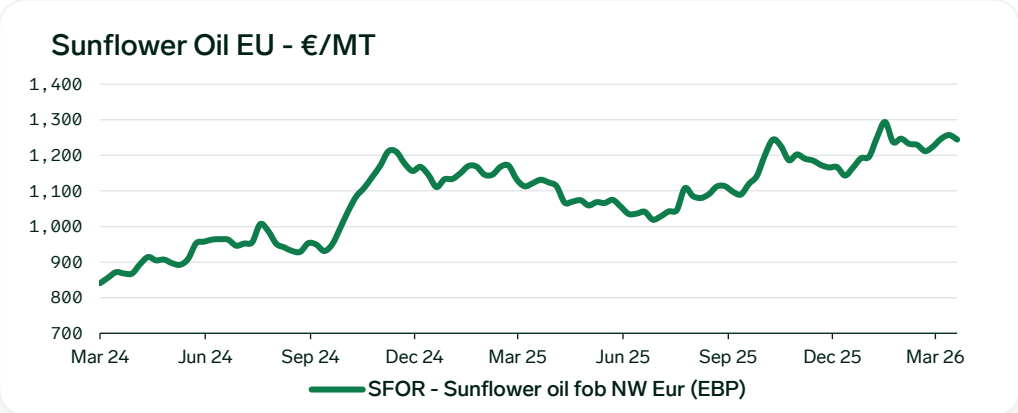
Sunflower Oil; Soyabean & Soyabean Oil



The average weekly price of US Soyabean as of March 25 increased by 2.1% MOM and rose by 15.7% YOY to $427.69/MT. Soybean prices have been supported from spillover from crude oil prices due to the US-Iran war. Currently, this has superseded many of the bearish fundamentals in the soybean market. Market players say that as long as crude oil is volatile the soybean complex will follow as oilseeds are more like energy commodities due to biofuel mandates.



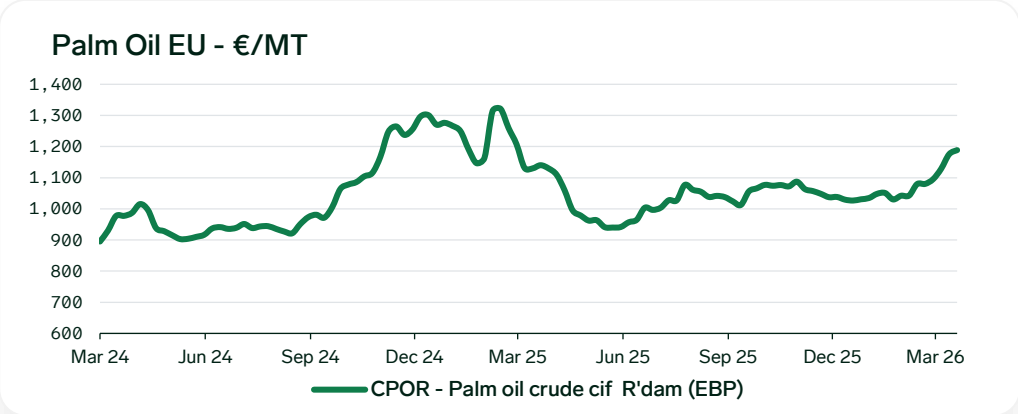
The average weekly price of US Soyabean Oil as of March 25 increased by 10.4% MOM and rose by 55.5% YOY to $1,452.08/MT. Soybean oil prices have tracked rallies in crude closely throughout the war in the conflict in the Middle-East, owing to price increases. Sources added that ongoing policy discussion surrounding biodiesel mandates added sensitivity to energy related rallies.



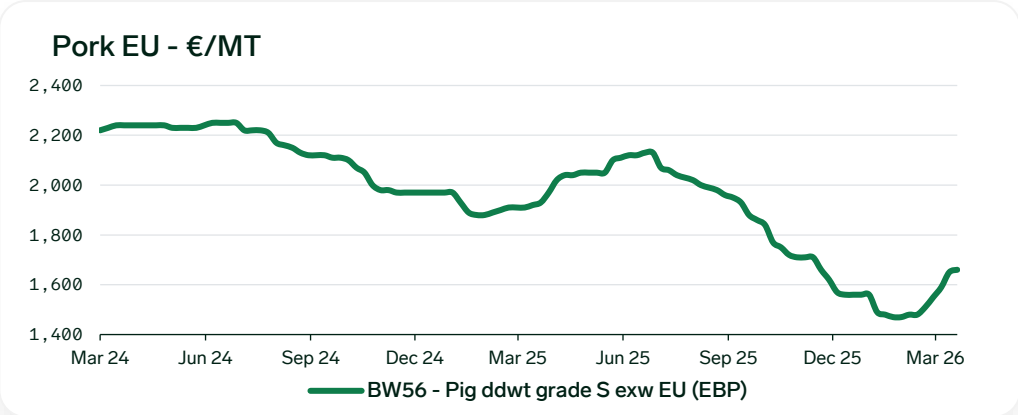
The average weekly price of EU Sunflower Oil as of March 25 increased by 2.7% MOM and rose by 10.0% YOY to €1,244.36/MT. Market players said that lower black sea processing activity and wider vegetable oil price increases have supported EU sunflower oil values.

Oilseeds and Vegetable Oils

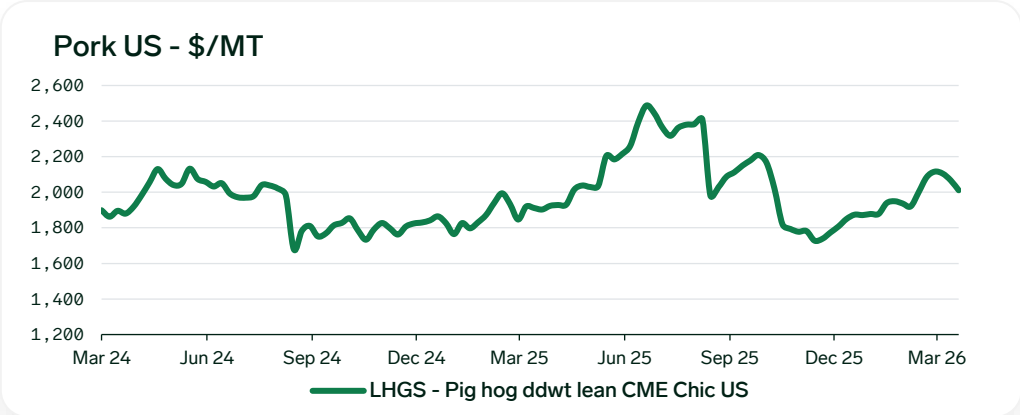
Palm Oil



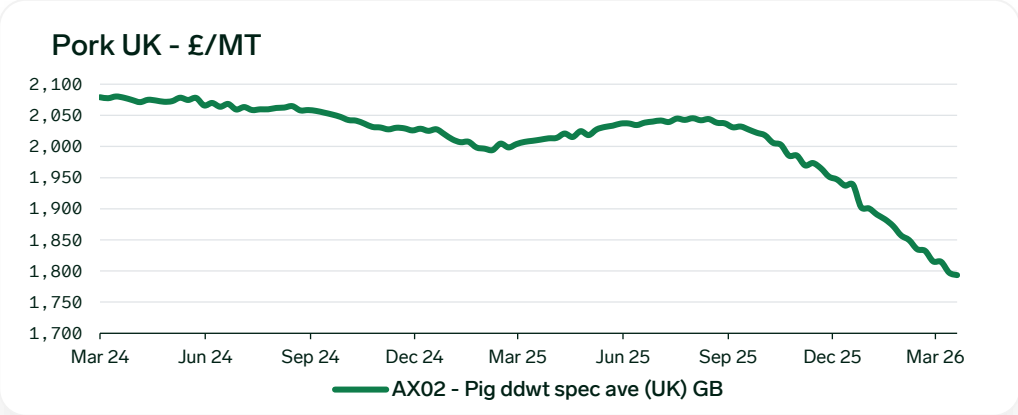
The average weekly price of EU Palm Oil as of March 25 increased by 10.0% MOM and rose by 4.2% YOY to €1,188.60/MT. EU palm oil prices found significant support due to wider vegetable oil and crude oil rallies that occurred during the strait of Hormuz crisis in the middle east. Sources said that palm oil has tracked crude prices very closely amid market uncertainty, increasing volatility further. Despite this, the market is well supplies and sources expect downward correction in the near term if crude oil follows the same trajectory.



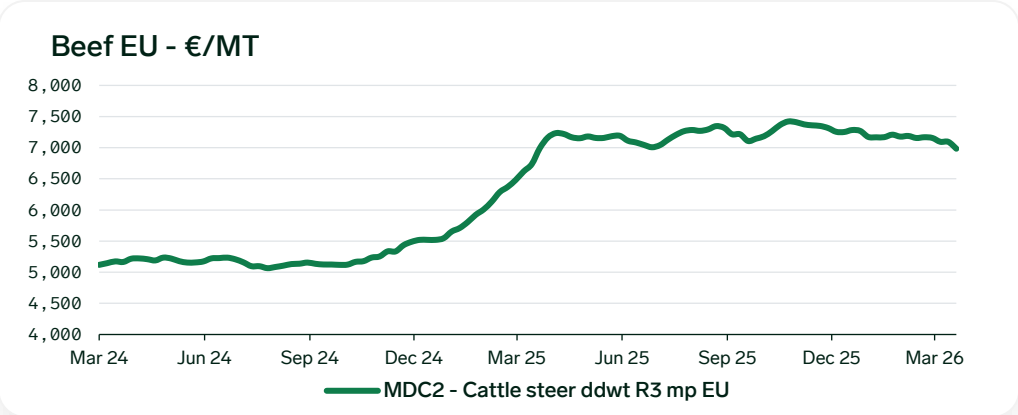
The average weekly price of EU Pork as of March 25 increased by 9.9% MOM and declined by 14.0% YOY to €1,660/MT. EU pork market sentiment remained firm throughout March, driven by strong demand across both domestic and international markets. Domestic demand was supported by seasonal demand patterns, as processors prepared for the grilling season. Supply was reported as slightly tighter, with fewer slaughter-ready pigs available, providing additional support to prices.



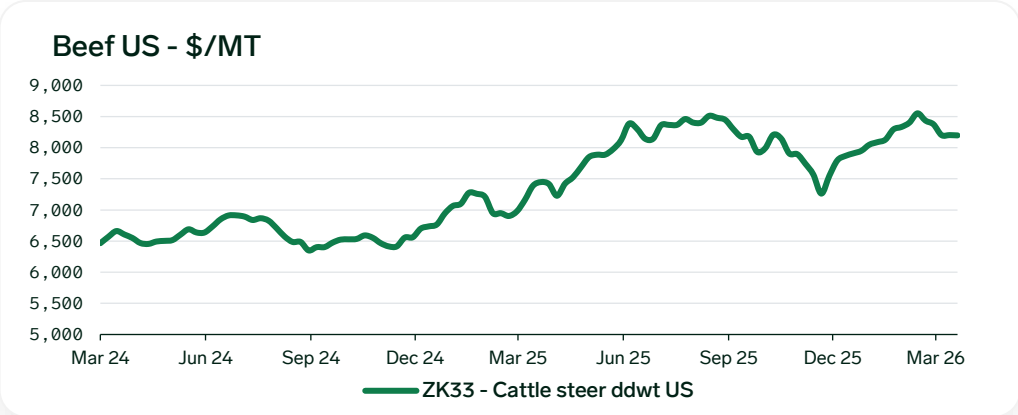
The average weekly price of US Pork as of March 25 decreased by 3.5% MOM and rose by 5.7% YOY to $2,010.90/MT. During March, market sentiment across the US pork complex was weak, with prices decreasing as sufficient supply met slower demand. Despite the decline, prices remain elevated compared to the previous year.



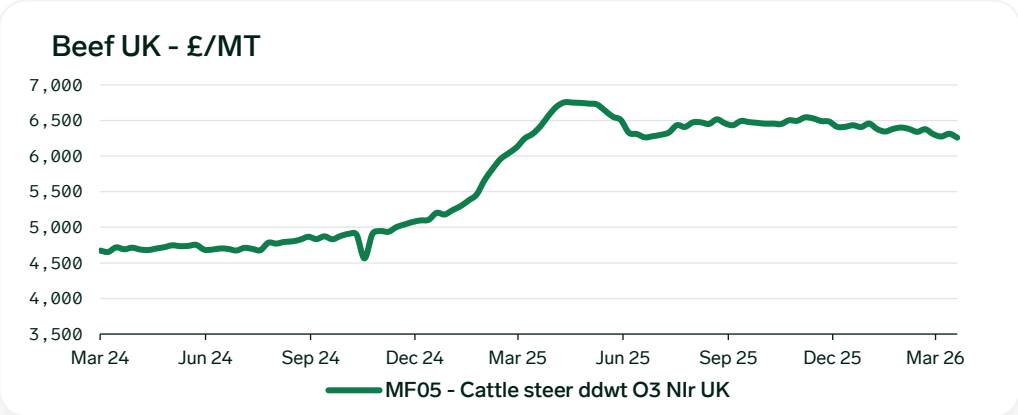
The average weekly price of UK Pork as of March 25 decreased by 2.1% MOM and declined by 10.8% YOY to £1,793.40/MT. Unlike the EU pork market, UK price levels declined during March. Supply and demand were reported as balanced, with little spot buying activity observed as demand was reported as well covered.



The average weekly price of EU Beef as of March 25 decreased by 2.6% MOM and declined by 0.1% YOY to €6,983.36/MT. According to market participants, overall market conditions remained subdued, with weak demand offsetting ongoing supply tightness. On a year over year (YOY) basis, prices have remained firm, largely supported by persistent supply-side constraints. Market participants note that the deadweight beef segment continues to demonstrate resilience, underpinned by limited cattle availability and steady demand from key buyers across mainland Europe and the United Kingdom.

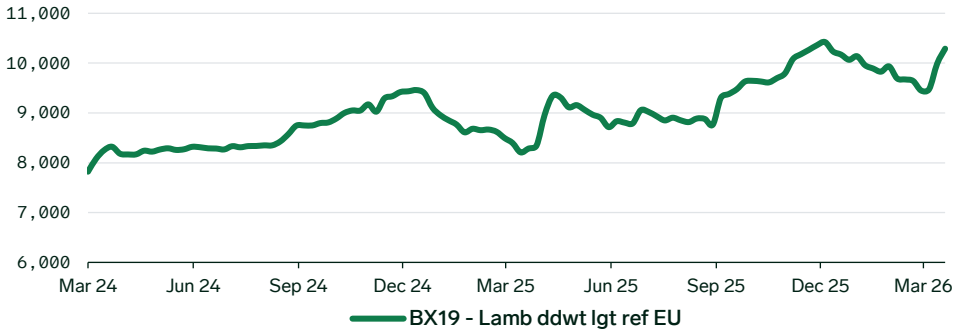


The average weekly price of US Beef as of March 25 decreased by 2.8% MOM and rose by 10.1% YOY to $8,197.14/MT. Cattle slaughter continued to fall short of the prior year. YTD slaughter was 7.9% lower as of March 21st. The average dressed steer weight as of March 21st was 898 lbs, up 27 lbs YOY and 6 lbs lower WOW, according to the US Department of Agriculture (USDA). The USDA's Economica Research Service (ERS) estimated beef production for 2026 was 25.810 billion lbs, 1.0% lower than 2025 levels.



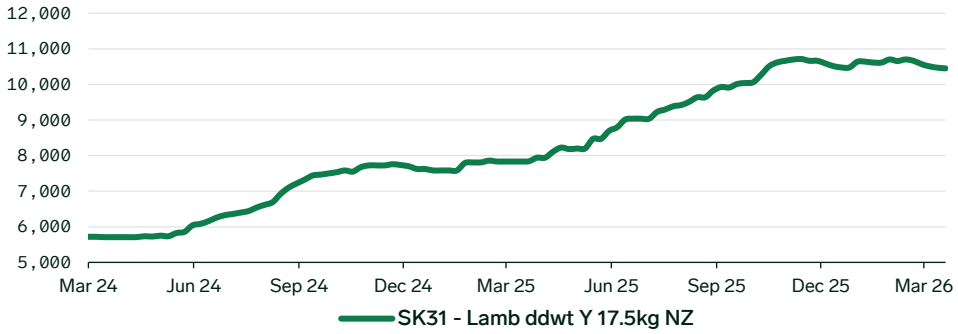
The average weekly price of UK Beef as of March 25 decreased by 1.9% MOM and declined by 2.6% YOY to £6,260/MT primarily due to subdued demand. The most pronounced declines were observed in cuts such as round and roasting joints. Market participants attribute this weakness to warmer weather conditions, which have dampened seasonal demand for these products. Prices for cuts such as rump, fillet, and striploin have also softened, with market participants noting that substantial inventories of steak cuts accumulated since February 2026 have weighed on the market.

Lamb EU - €/MT



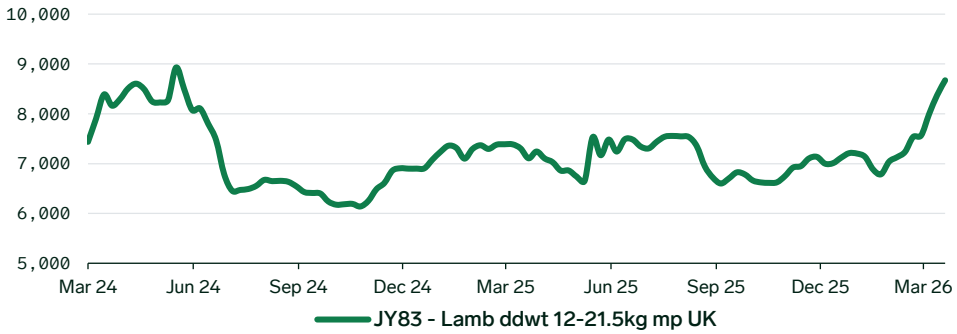
The average weekly price of EU Lamb as of March 25 increased by 6.7% MOM and rose by 24.2% YOY to €10,290.10/MT. Following strong price gains during the second half of last year, the market remained elevated in early 2026, reflecting continued supply tightness rather than short-term seasonal fluctuations. According to AHDB, EU sheep prices started 2026 in a robust position, supported by constrained domestic production, steady consumer demand and tighter livestock availability across key producing regions. The European Commission also showed the EU light lamb reference price at €1,029.0/100kg in week 13, confirming the strong late-March recovery.

Lamb New Zealand - NZD/MT



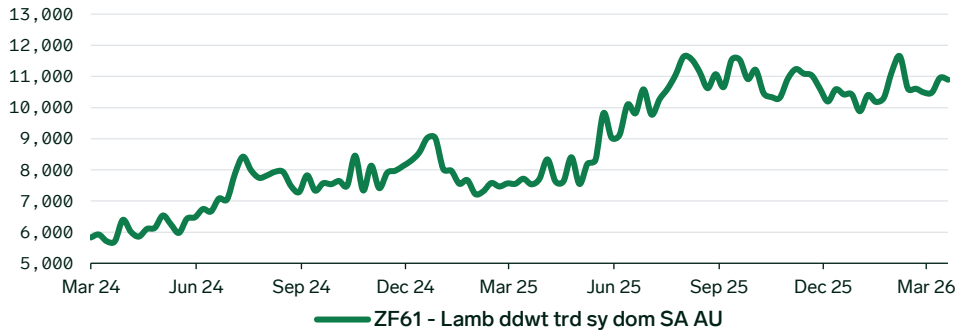
The average weekly price of New Zealand Lamb as of March 25 decreased by 2.0% MOM and rose by 33.3% YOY to NZD 10,452.57/MT. Demand conditions were described as moderate overall, with some seasonal slowing following earlier procurement. Export interest remained supportive, particularly from Asian markets, though activity was less active compared to February. Seasonal lamb availability in New Zealand was viewed as adequate but tightening from earlier peaks due to lower seasonal throughput and ongoing flock rebuilding, which limited downside pressure despite the softer MOM movement. The strong YOY increase continued to reflect tighter global lamb availability, which has kept prices elevated as seasonal supplies begin to shift.

Lamb UK - £/MT

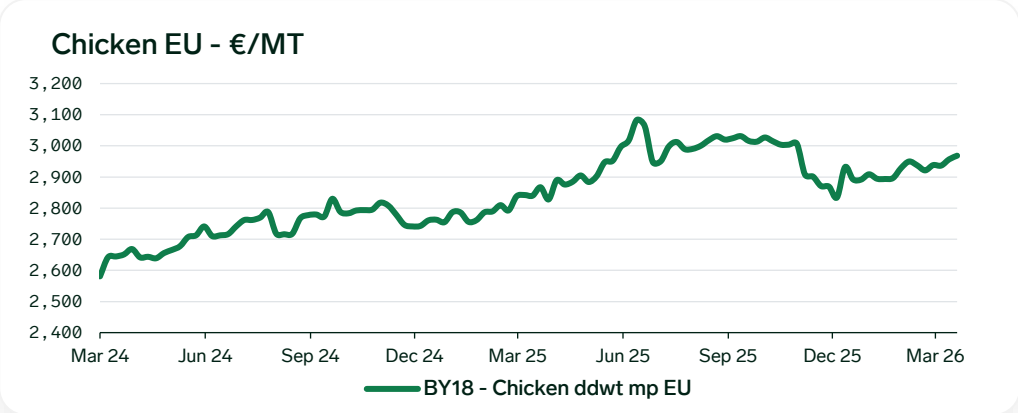


The average weekly price of UK Lamb as of March 25 increased by 15.1% MOM and rose by 22.0% YOY to £8,673/MT. UK lamb prices strengthened sharply during March as seasonal buying ahead of Easter and Ramadan met tightening market-ready supply. While carryover lambs had supported slaughter earlier in the season, AHDB noted that tighter availability is expected later in the year, with UK sheep meat production forecast to fall by around 3% YOY in 2026. This kept sentiment firm and helped lift prices to their highest level in recent months.

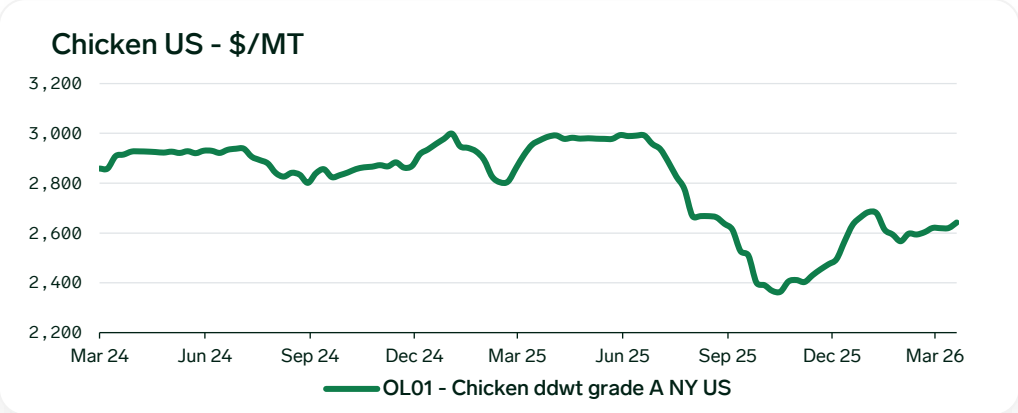
Lamb Australia - AUD/MT



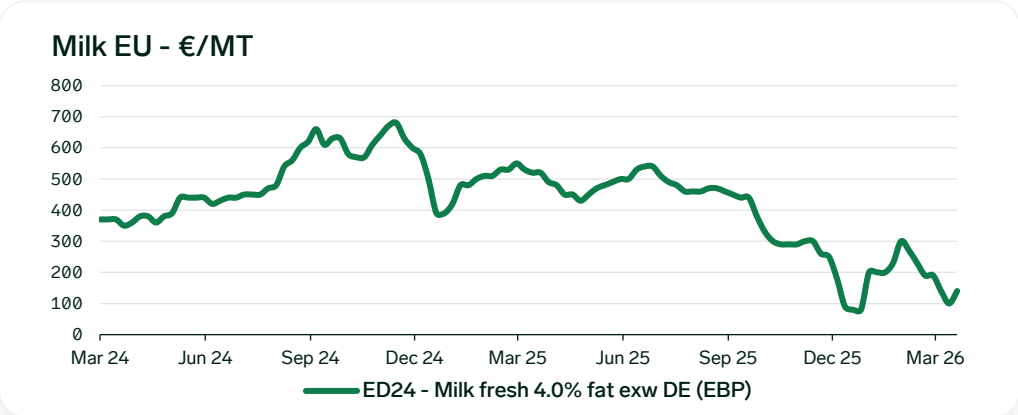
The average weekly price of Australian Lamb as of March 25 increased by 2.7% MOM and rose by 44.6% YOY to AUD 10,893.67/MT. Demand conditions were described as moderate overall, with export interest from key markets remaining active. US demand was viewed as moderate as most buying has largely wrapped up ahead of Easter, while Asian demand continued to provide more consistent support. Supply was described as somewhat tighter through March, reflecting ongoing flock rebuilding and lower seasonal throughput. Seasonal production patterns during March continued to keep near-term availability somewhat limited. The strong YOY increase continued to reflect tighter global lamb availability, which has kept prices elevated as seasonal supply trends shift.



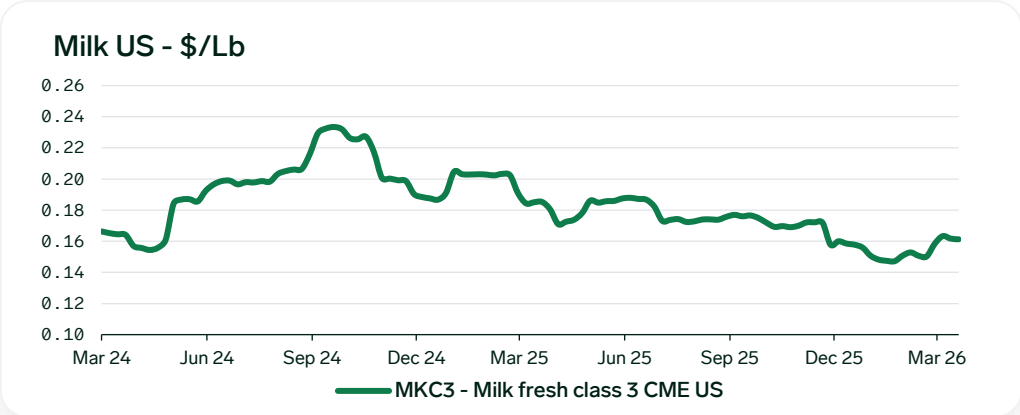
The average weekly price of EU Chicken as of March 25 increased by 1.6% MOM and rose by 3.5% YOY to €2,968.31/MT, supported by a gradual recovery in demand across the region. At the same time, tightening supply conditions, largely driven by ongoing outbreaks of Newcastle disease (ND) and highly pathogenic avian influenza (HPAI), have intensified concerns among market participants across the EU. This combination of firmer demand and mounting production risks is contributing to a more bullish price environment.



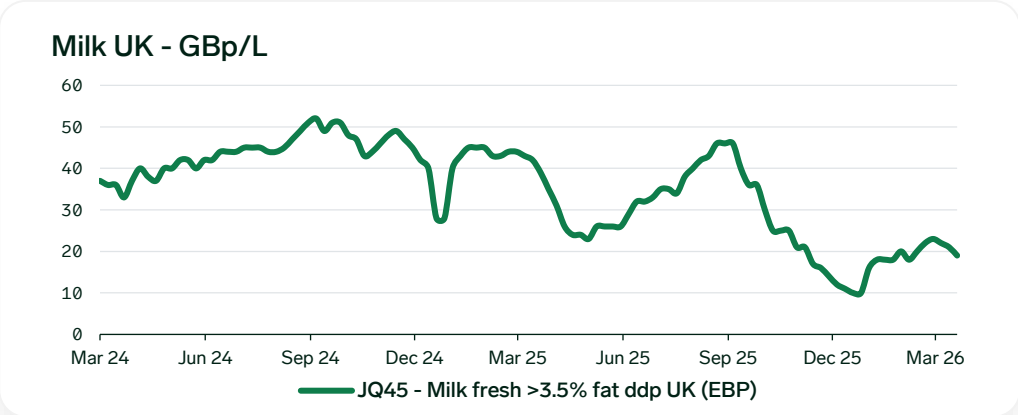
The average weekly price of US Chicken as of March 25 increased by 1.5% MOM and declined by 11.1% YOY to $2,642.21/MT. Market conditions surrounding 3-3.5lb. US WOGs were balanced through the first half of the month, though consistent demand out of retail purchasing channels, in conjunction with an uptick in cutting and deboning demand, drove this segment upward in value towards the month's end. When compared to the month prior, this segment averaged a 1.91% increase, with YOY comparisons standing at -20.54% lower.



The average weekly price of EU Milk as of March 25 decreased by 26.3% MOM and declined by 73.1% YOY to €140/MT. Spot milk prices continued to decrease in March, driven by strong supply weighing on price levels across the EU and Germany. Demand was reported as steady throughout the period.

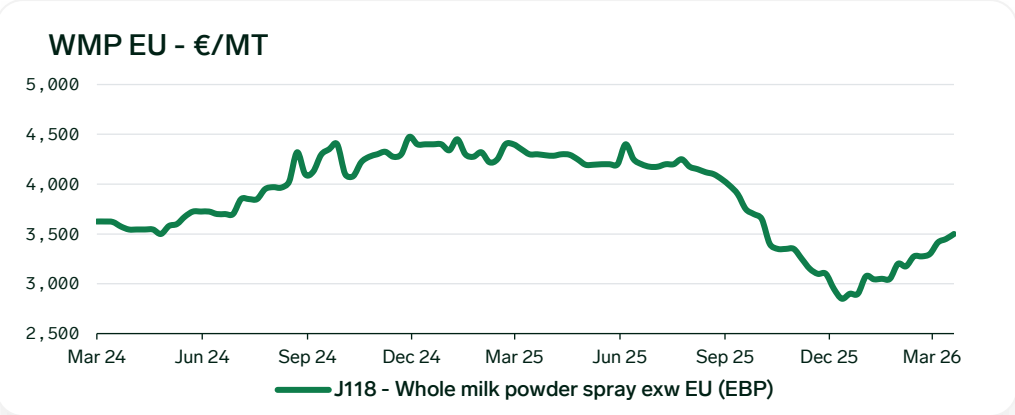


The average weekly price of US Milk as of March 25 increased by 7.3% MOM and declined by 12.9% YOY to $0.16/Lb. Class III Milk Prices: Class III milk prices increased during the month of March but remained below year-over-year (YOY) comparative levels . Consistently strong milk production throughout the early months of 2026 maintained downward pricing pressure despite the month-over-month (MOM) gains, as abundant milk supplies limited the potential for significant price appreciation. Market participants anticipated further production acceleration heading into the approaching spring flush season.

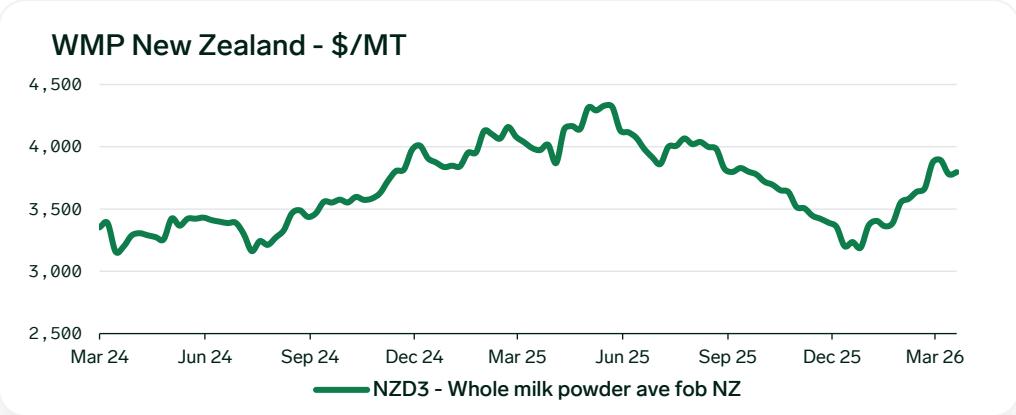


The average weekly price of UK Milk as of March 25 decreased by 13.6% MOM and declined by 51.3% YOY to GBp 19/L. Prices continued declined MOM in line with the seasonal trend. Milk intakes remain elevated compared with last year. Processing capacity remains tight, and processors remain reluctant to separate milk, which is restricting demand for spot volumes. Overall, the market remains under pressure in the short term, with limited drivers for a sharp rebound and a fragile balance between available milk and processing capacity

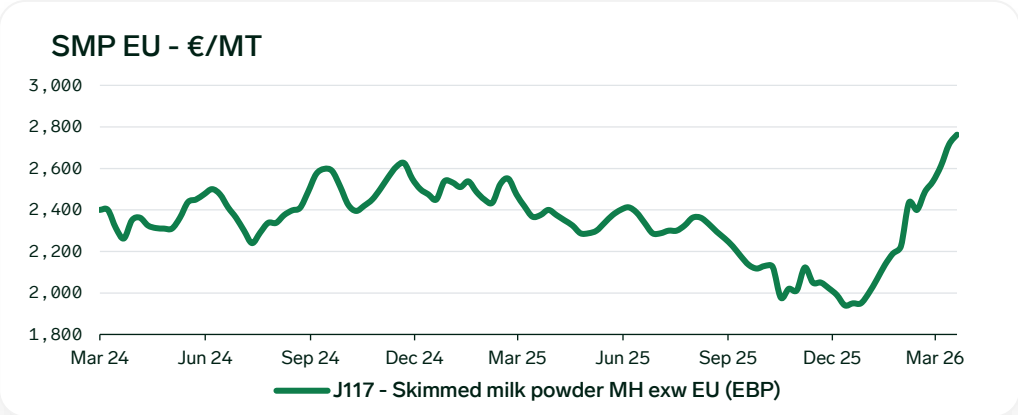
Whole milk powder



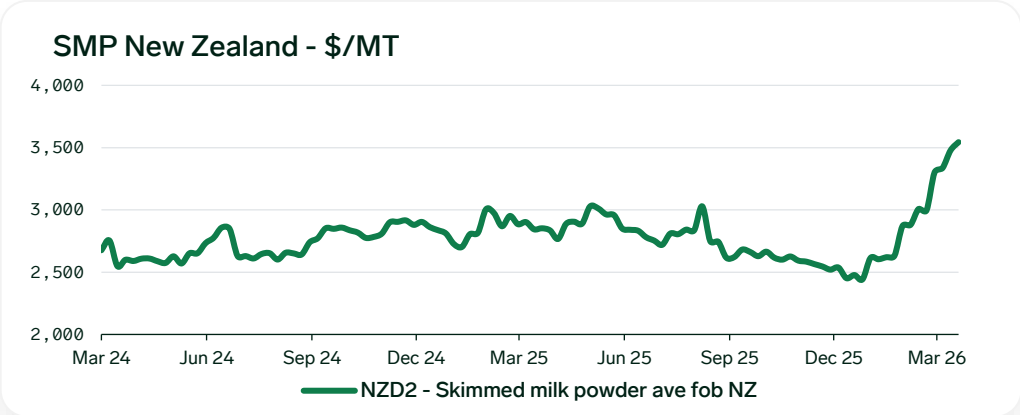
The average weekly price of EU WMP as of March 25 increased by 6.9% MOM and declined by 18.6% YOY to €3,500/MT. EU whole milk powder (WMP) prices continued to rise in March, with firm market sentiment supported by strong domestic and international demand. Supply increased marginally during the month, as higher milk intakes supported fresh production.



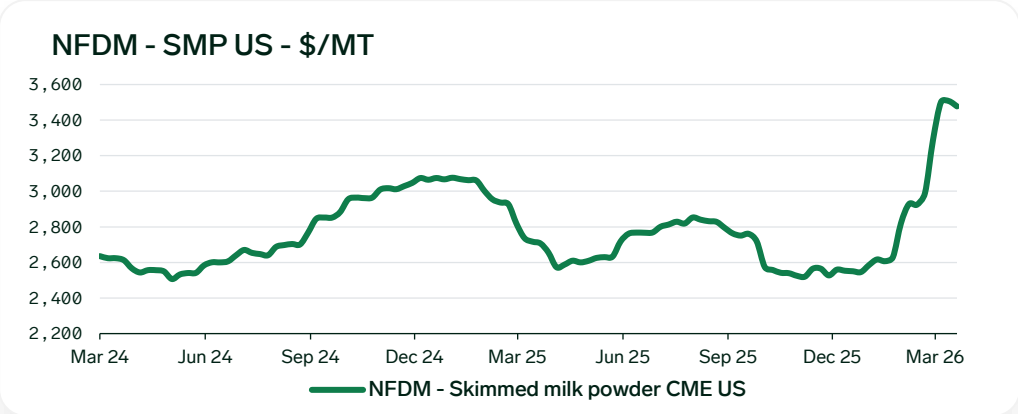
The average weekly price of New Zealand WMP as of March 25 increased by 3.6% MOM and declined by 4.5% YOY to $3,796.50/MT. Demand from Asia supported prices. However, with the seasonal milk collection peak already past, WMP production was reported to be strong with dairy processors taking advantage of surplus milk volumes. This has resulted in elevated stock levels, keeping prices below those seen in the same period last year.



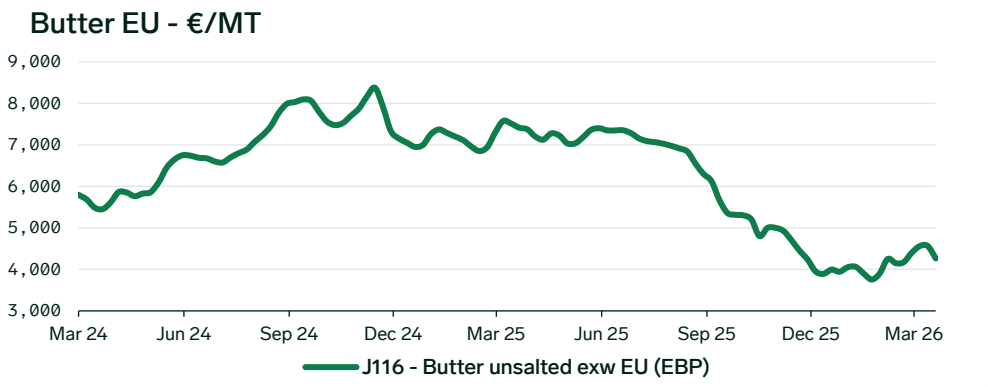
The average weekly price of EU SMP as of March 25 increased by 11.1% MOM and rose by 16.3% YOY to €2,762.50/MT. International demand increased slightly during March, driven by buying interest from North Africa and the Asia-Pacific (APAC) region. Further tight US supply of non-fat dry milk (NFDM) and skimmed milk powder (SMP) led to increased demand for EU product to balance the global market. Middle Eastern demand was reported as limited, linked to the conflict between the US, Israel, and Iran. Domestic demand was reported as strong throughout the month, boosting upward price movement.



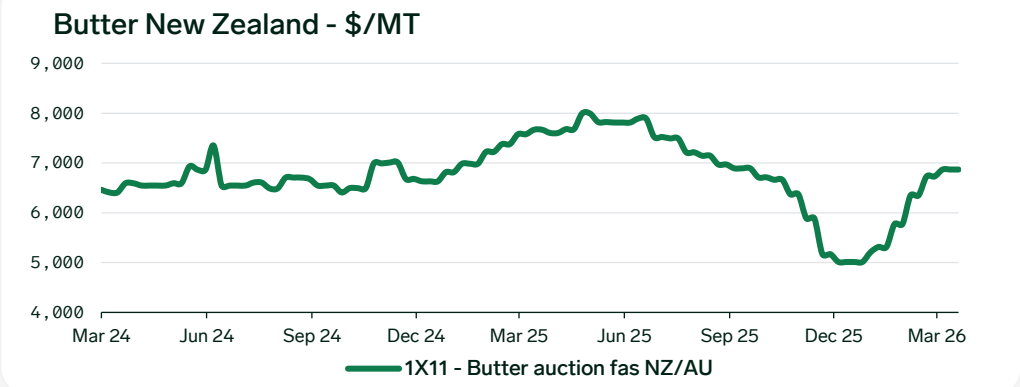
The average weekly price of New Zealand SMP as of March 25 increased by 18.3% MOM and rose by 24.2% YOY to $3,544.02/MT. New Zealand milk production is rising on strong pasture and strong prices. Lower Chinese participation at the latest Global Dairy Trade auction was offset by MENA and Southeast Asia demand, lifting prices, while exports remain subdued.



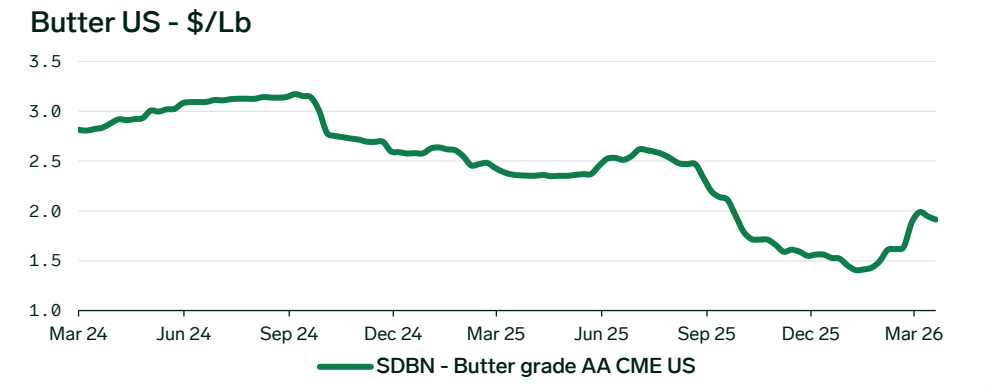
The average weekly price of US NFDM - SMP as of March 25 increased by 16.3% MOM and rose by 28.5% YOY to $3,476.98/MT. NFDM prices continued to increase as constrained production and tight inventory levels supported bullish market sentiment. Processors continue to divert milk into higher profit margin production streams, leaving limited volumes for NFDM production. The deliberate shift in production priorities by major manufacturers, coupled with sustained international and domestic demand for NFDM, reinforced the bullish pricing environment



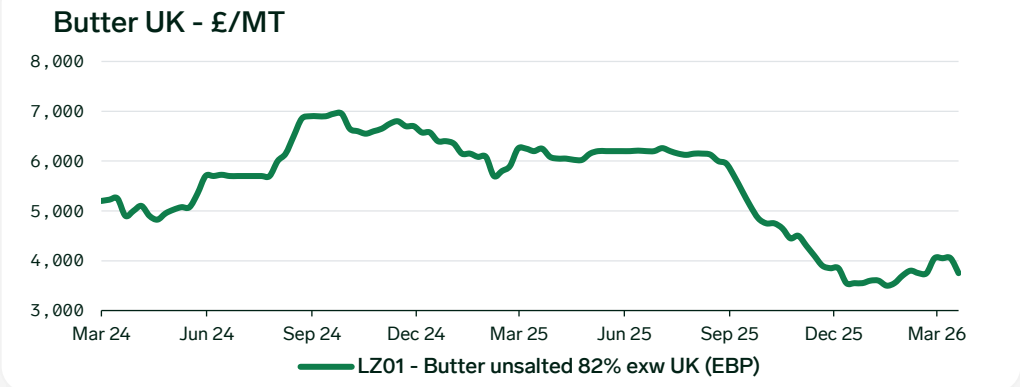
The average weekly price of EU Butter as of March 25 increased by 2.2% MOM and declined by 42.5% YOY to €4,262.50/MT. EU butter prices moved higher during the month but remained substantially below 2025 values. Strong milk flows continue to weigh on prices ahead of the spring flush. Despite the upward monthly movement, prices saw only modest gains as strong domestic demand tied to the Easter holiday provided temporary support.



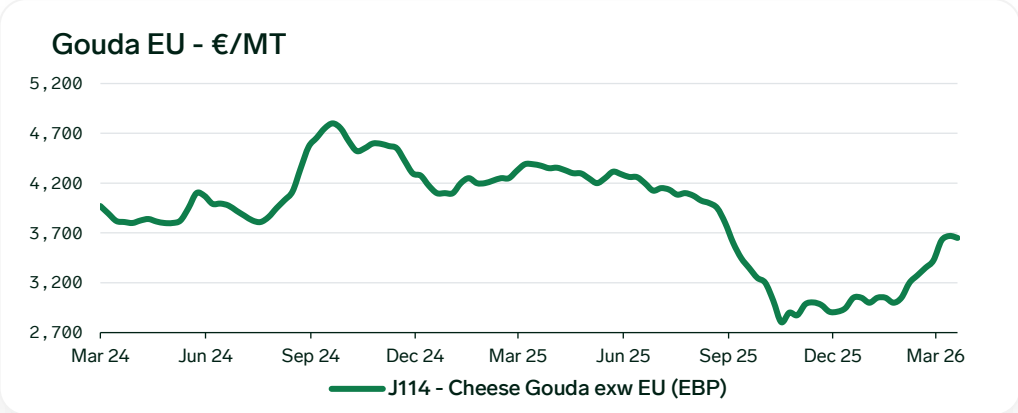
The average weekly price of New Zealand Butter as of March 25 increased by 2.1% MOM and declined by 10.4% YOY to $6,868/MT. New Zealand milk production is rising on strong pasture and strong prices. Butter prices rose again at the latest Global Dairy Trade auction, despite softer demand and reduced Chinese buying. Prices are now well above global levels and, while they typically rise in Q1, are expected to ease thereafter.



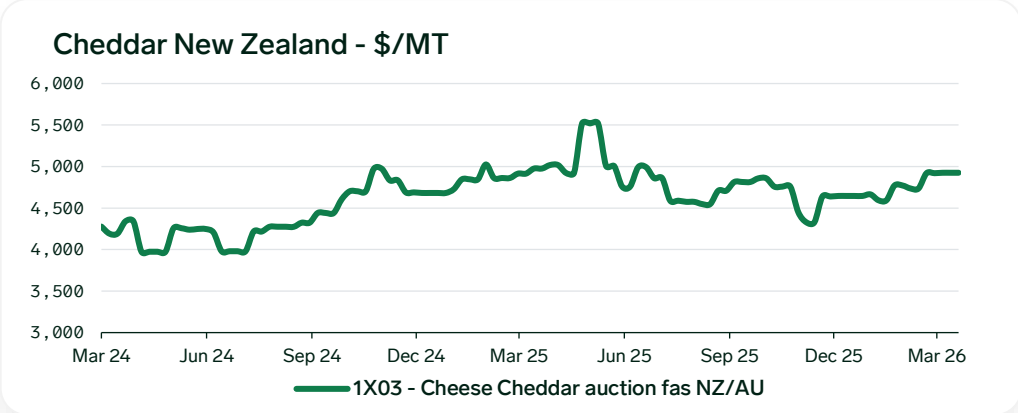
The average weekly price of US Butter as of March 25 increased by 16.8% MOM and declined by 18.9% YOY to $1.91/Lb. While butter prices improved during the month, they remained below year-over-year (YOY) comparative levels. Strong milk production and elevated milk components resulted in a surplus of cream availability, providing butter churns with ample volumes for production. Domestic demand remained steady to weak, providing insufficient purchasing interest to absorb the elevated production levels, and continued to weigh on prices.



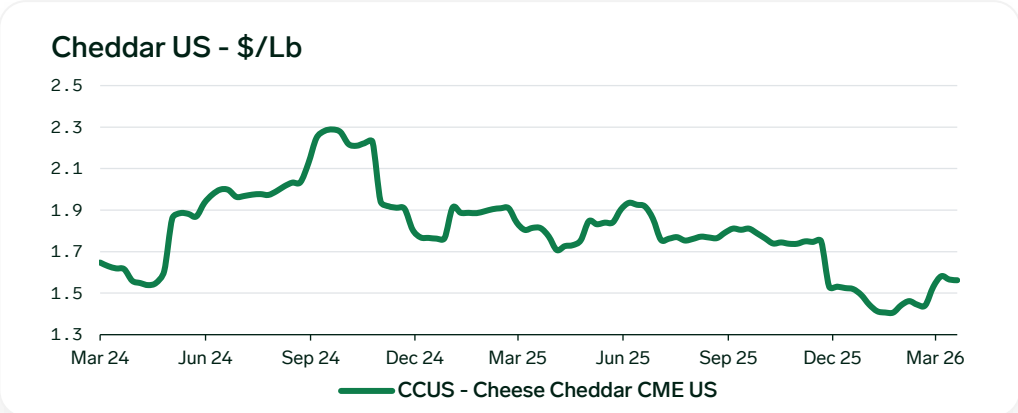
The average weekly price of UK Butter as of March 25 was unchanged MOM and declined by 40.0% YOY to £3,750/MT. The UK butter price levels were unchanged in March. Rising freight and logistics costs, driven by geopolitical tensions, have caused some market participants to step back, leading to a loss of price momentum and stagnation in parts of the market toward the end of the period.



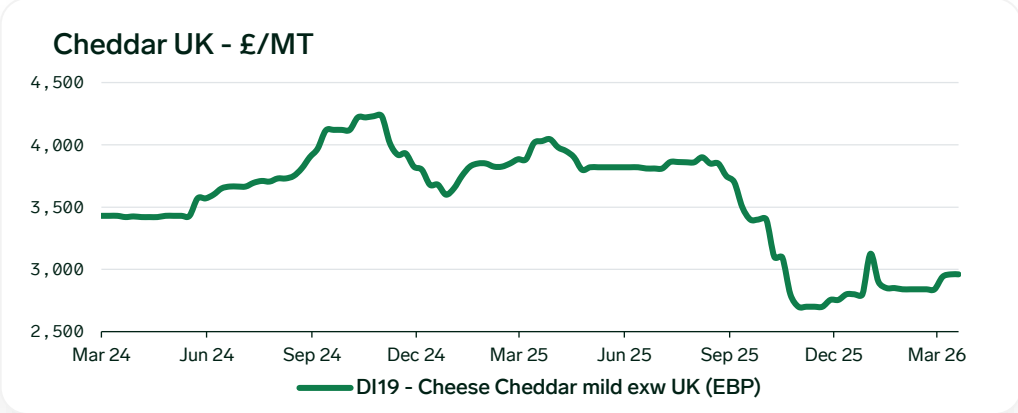
The average weekly price of EU Gouda as of March 25 increased by 9.0% MOM and declined by 16.6% YOY to €3,650/MT. Gouda market activity continued to rise in March. Following low prices during Q4 2025, demand returned to the market incentive by low prices. Some producers were sold out for March with limited prompt availability. However, uncertainty keeps many buyers cautious, favoring hand-to-mouth purchasing or waiting for price corrections.



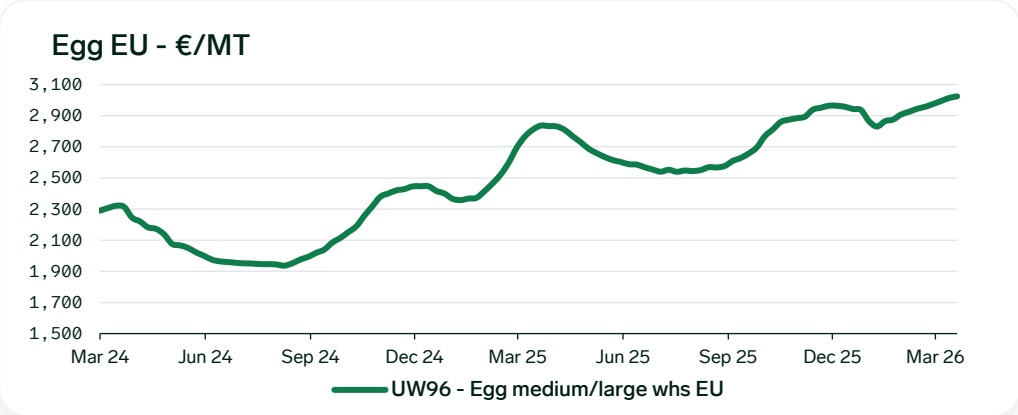
The average weekly price of New Zealand Cheddar as of March 25 increased by 0.1% MOM and declined by 1.0% YOY to $4,925/MT. New Zealand Cheddar cheese prices were stable in March remaining above global averages. Strong demand from MENA supported the market, with prices expected to gradually align with global levels over the year.



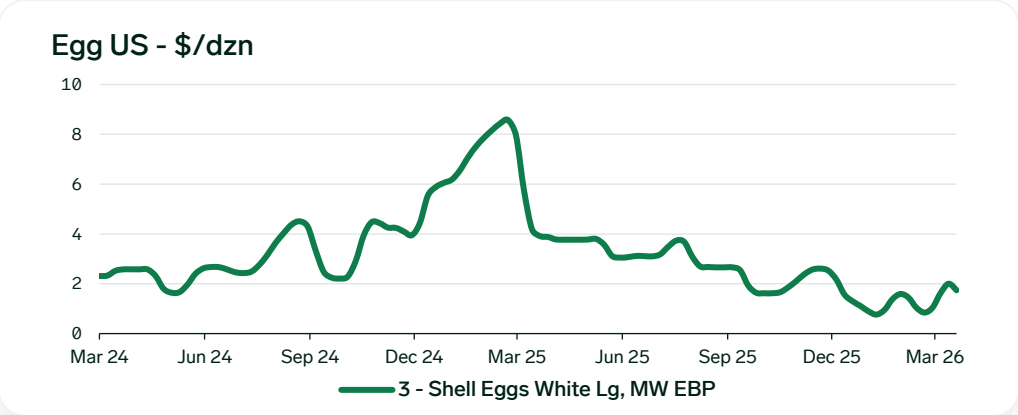
The average weekly price of US Cheddar as of March 25 increased by 8.4% MOM and declined by 13.8% YOY to $1.56/Lb. Similar to the broader US dairy market, cheese prices rebounded during the month but remained below the previous year's levels. Cheese production continued to increase month over month (MOM) as new and expanding production facilities ramped up operations and absorbed increased milk supplies. US cheese products maintained a favorable price discount relative to global competitors, expanding international demand and absorbing increased production.



The average weekly price of UK Cheddar as of March 25 increased by 4.2% MOM and declined by 26.6% YOY to £2,960/MT. UK Cheddar prices increased in March. Stocks are tight—particularly for mature—after strong curd sales last year. Demand remains firm, but overall market confidence remains low amid potential trade disruptions.



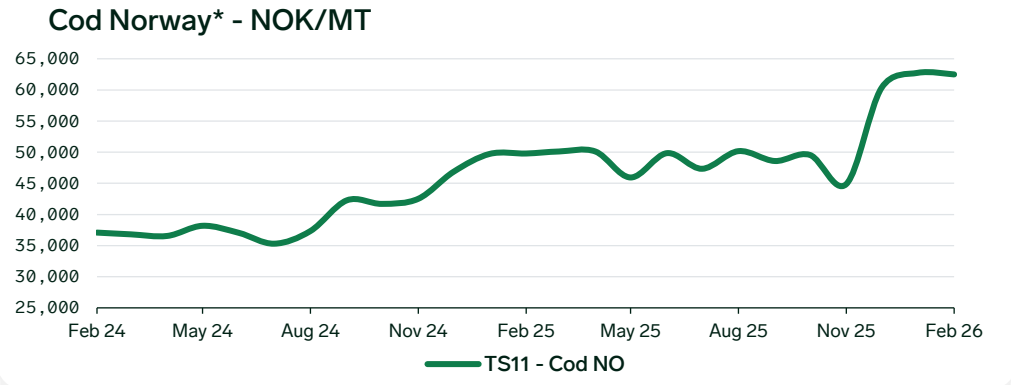
The average weekly price of EU Egg as of March 25 increased by 2.3% MOM and rose by 6.6% YOY to €3,023.80/MT. Retail demand remained solid throughout March, driven by seasonal Easter-related buying. This sustained supermarket throughput across the EU and contributed to a progressive tightening in shell egg availability ahead of the holiday period. In response, packers concentrated on fulfilling retail commitments, reducing the allocation of higher-welfare eggs to processors and thereby reinforcing firmness in premium price segments. At the same time, Newcastle disease outbreaks in parts of the EU, notably Germany, intensified supply uncertainty, and led retailers to take a more cautious approach to buying.



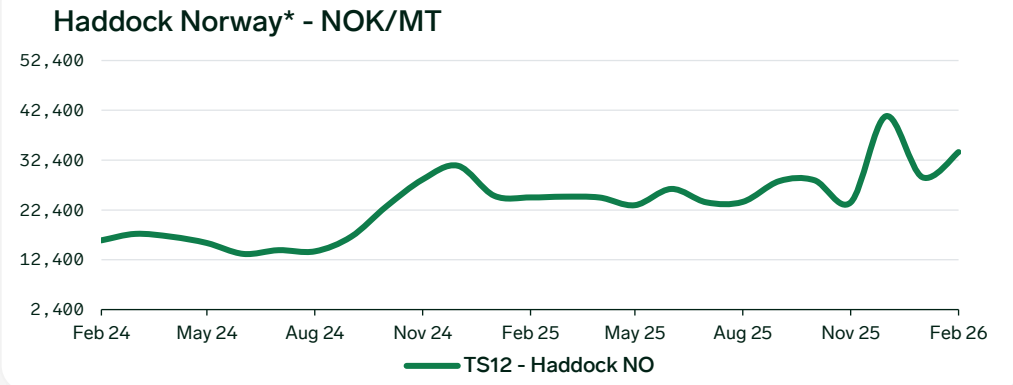
The average weekly price of US Egg as of March 25 increased by 106.2% MOM and declined by 55.5%YOY to $1.74/dzn. The Easter period, widely considered one of the largest egg-related holidays in the US, saw underwhelming performance this year. This was driven by a combination of continued production growth, earlier-than-usual procurement in March, and a shift toward plastic eggs for dyeing. Production has continued to increase, as reflected in the March US layer count reaching 315 million birds, a 52-week high, indicating ongoing repopulation following last year's HPAI losses.

With buyers pulling product earlier in March than is typical, the market experienced a period of strength before softening quickly as demand tapered off ahead of the holiday. Many participants reported being well stocked, which limited additional buying. Movement during the holiday was described as fair at best, with generally lackluster sales. The shift away from real egg dyeing further contributed to weaker demand, allowing inventories to build.

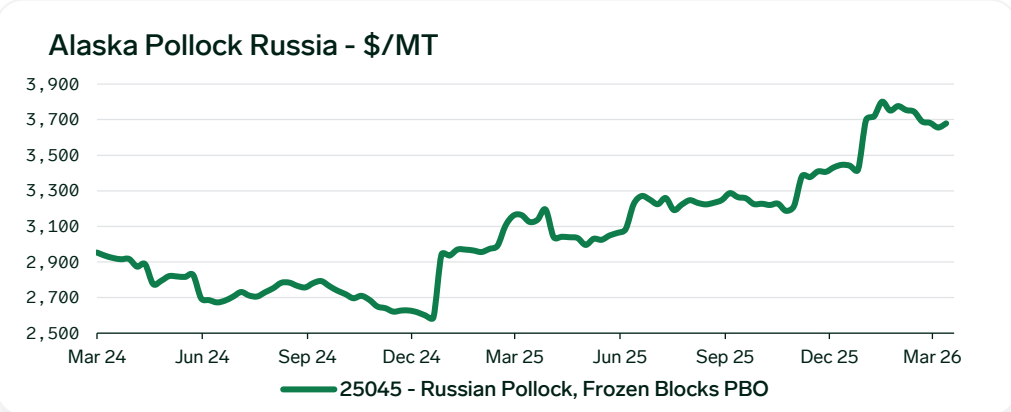
As a result, total shell egg inventories climbed to 1.622 million cases this week, marking a four-year high. The market currently remains weak across all egg types, colors, sizes, and pack types.



In February, the average price of Norwegian Cod decreased by 0.4% MOM and rose by 25.5% YOY to NOK 62,485.40/MT. Market participants indicated that Norwegian cod landings have improved significantly recently. According to the Directorate of Fisheries, catches increased 152.1% in February, but accumulated catches through February declined 4.1% year to date (YTD). This may explain the decline in price MOM, in contrast to the YOY price increase, it may be associated with the current Total Allowable Catch for 2026, which is 16% lower than 2025.

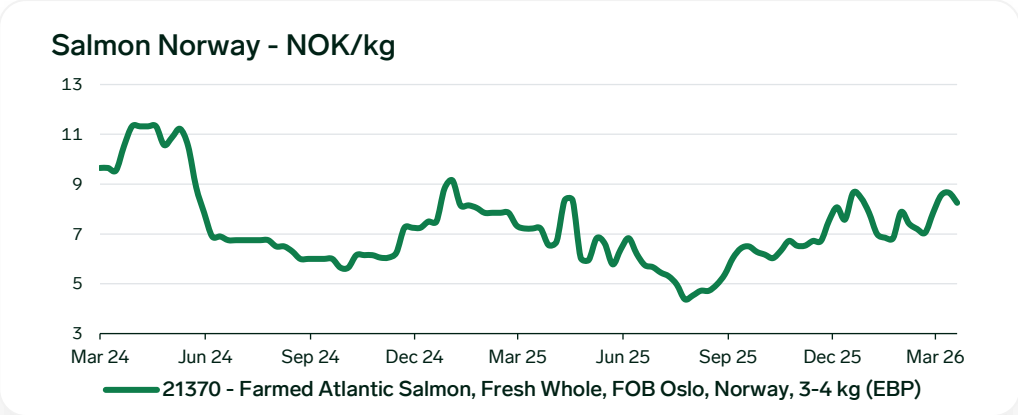


In February, the average price of Norwegian Haddock increased by 17.4% MOM and rose by 36.5% YOY to NOK 34,024.40/MT. As other whitefish species remain under upward pressure such as Alaska pollock and cod, Norwegian haddock has been following the trends, despite the significant increase in availability. According to the Directorate of Fisheries, catches were 45.9% higher YOY in February, and accumulated landings through February increased 22.7% YTD.

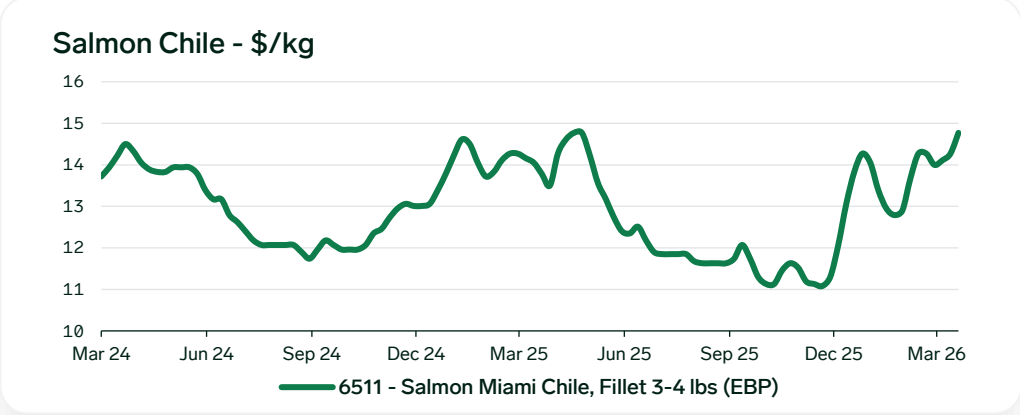


The average weekly price of Russian Alaska Pollock as of March 25 decreased by 1.8% MOM and rose by 17.7% YOY to $3,679.15/MT. The pollock market in Europe remains active, with market participants reporting fair demand due to low availability of other whitefish such as Atlantic cod. The slight price decrease MOM reflects a weak euro against the US dollar and does not indicate real market sentiment. Market participants are reporting upward pressure on prices for Russian pollock products. According to the Russian Federal Agency for Fisheries, pollock landings through March 16 amounted to 698,600 MT, which is 66,000 MT lower than the same period in 2025.

*February 2026 is the last available data.

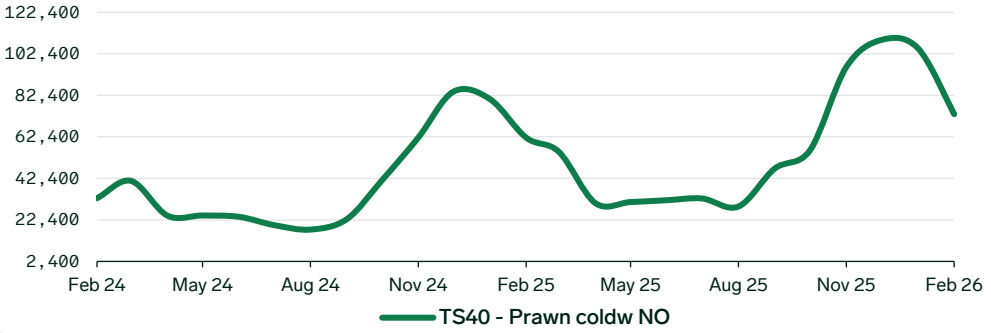


The average weekly price of Norway Salmon as of March 25 increased by 17.0% MOM and rose by 14.3% YOY to NOK 8.25/kg. During March, the price for Norwegian salmon was firm as market participants reported a moderate to fair demand, which was supported by the Easter holidays. According to Statistics Norway, reported cumulative fresh Atlantic salmon exports of 246,524 MT through week 13, up 13.1% YTD.



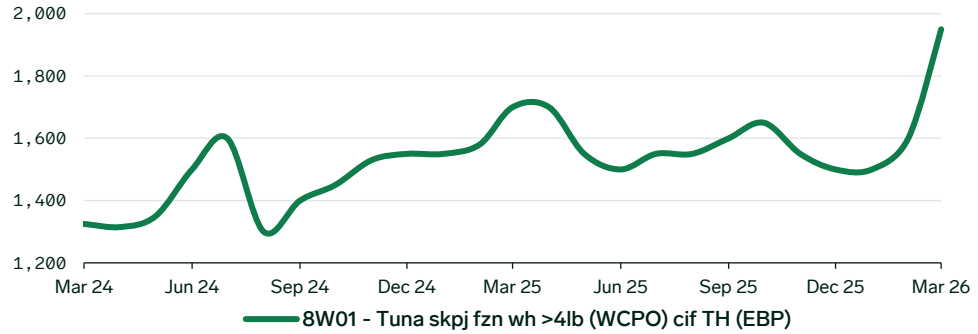
The average weekly price of Chilean Salmon as of March 25 increased by 3.5% MOM and rose by 7.2% YOY to $14.77/kg. The price for Chilean salmon in the US market was under upward pressure as a result of limited availability reported by market participants. This may be an effect of contract trading leading the market. According to SUBPESCA, the harvest in 2026 remains strong, with accumulated harvest through February totaling 135,377 MT, a 26.5% increase YTD.

Prawn Norway* - NOK/MT



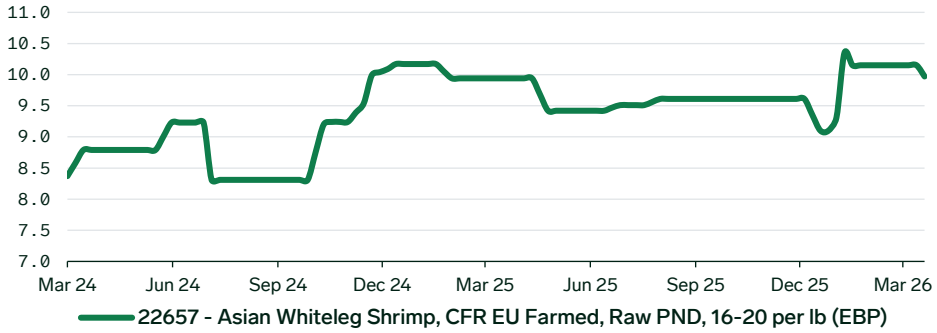
In February, the average price of Norwegian Prawn decreased by 30.3% MOM and rose by 18.2% YOY to NOK 73,328.67/MT. The month of February was significantly impacted by the Lunar New Year celebrations in China. While demand typically surges ahead of the holiday due to increased seafood purchases for festivities, import activity tends to slow during the celebration period itself, resulting in a temporary lull in shrimp imports. In addition, European demand was relatively weak in January and February this year, as importers largely relied on inventories carried over from late last year. As a result, prices in Norway have declined sharply since the beginning of the year. On a y-o-y basis, however, prices remain higher. This increase is supported by stronger global valuation of Norwegian prawns, as Norway has shifted its trade flows in 2025—exporting larger volumes directly to China rather than supplying raw material to European processors.

Tuna Thailand - $/MT



In March, the average price of Thai Tuna increased by 21.9% MOM and rose by 14.7% YOY to $1,950/MT. The significant price increase was mainly driven by increasing operational costs as the price of fuel and shipping costs have increased as a result of tensions in the Middle East. In addition, market participants continue to report that catches in the Western and Central Pacific Ocean fell short of expectations.

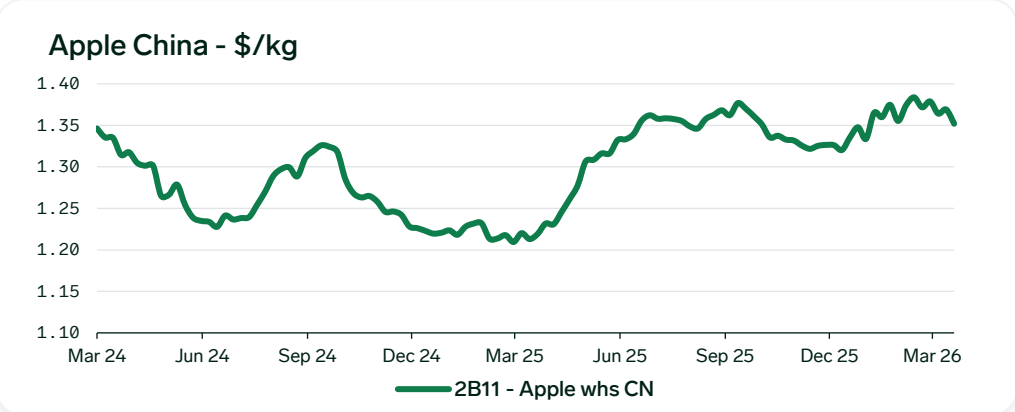
Asian Whiteleg Shrimp - $/kg



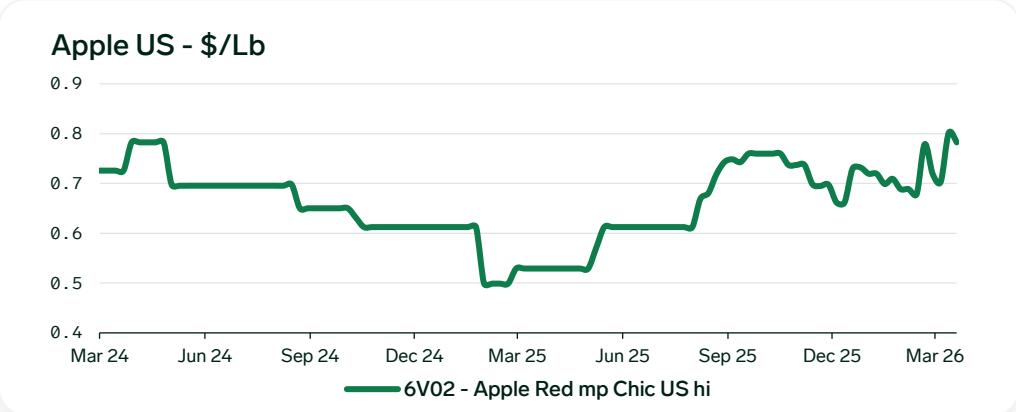
The average weekly price of Shrimp Asian Whiteleg as of March 25 decreased by 1.8% MOM and rose by 0.3% YOY to $9.97/kg. With the exception of the US, where demand for peeled shrimp remained relatively robust at the beginning of the year and during the Lent period, global market activity was more subdued in March. In China, the post–Lunar New Year period has been marked by cautious restocking, as buyers remain mindful of the geopolitical environment and rising oil prices. In Europe, purchasing interest has weakened since the start of the year, largely due to the availability of year-end inventories held in cold storage. As a result, Asian producers have temporarily reduced farmgate prices, leading to a corresponding decline in export prices.

* December 2025 is the last available data.

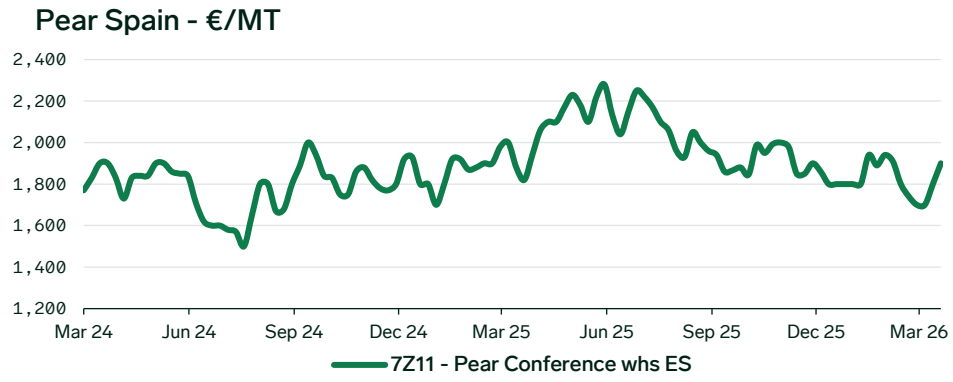
Apples



The average weekly price of Chinese Apple as of March 25 decreased by 1.4% MOM and rose by 10.9% YOY to $1.35/kg. China's apple production for the 2025/26 season stands at 47 million MT, according to figures published by the USDA, down by nearly 5% YOY. Production losses across the country stemmed from combinations of reduced acreage and a range of adverse weather events, including heavy rains, strong winds, drought, very high temperatures and frosts.



The average weekly price of US Apple as of March 25 increased by 0.5% MOM and rose by 47.9% YOY to $0.78/Lb. Overall, sources cite market stability. US fresh apple exports in the first half of the 2025/26 marketing year (August-July) were up by 5% YOY and stood at an eight-year high for that period, according to the USDA, with almost half of total exports going to Mexico and Canada. However, current market sentiment suggests steady conditions with limited near-term demand growth prospects for the rest of 2026.

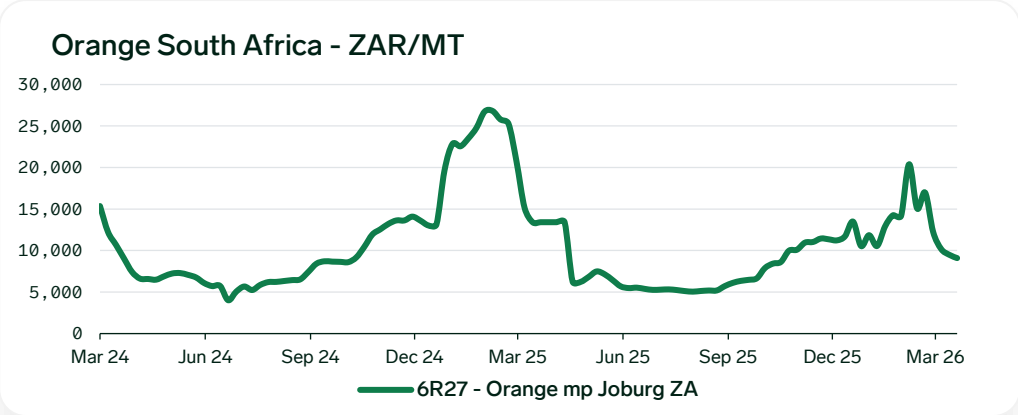


The average weekly price of Spanish Pear as of March 25 increased by 9.2% MOM and rose by 4.4% YOY to €1,900/MT. Market sources report a challenging outlook for Spain's pear market, as production volumes remain significantly below the average of recent years and storage challenges are reportedly negatively affecting fruit quality. In addition, Spain is struggling with tough competition from other European producers.

The average weekly price of Chinese Pear as of March 25 decreased by 1.2% MOM and rose by 5.1% YOY to CNY 6,610/MT. The Chinese pear sector continues to struggle with oversupply, according to sources. However, the market is under pressure from rising input costs and a labor shortage. In addition, domestic consumption patterns tend to favor higher quality fruit, which has been negatively affected by adverse weather conditions.

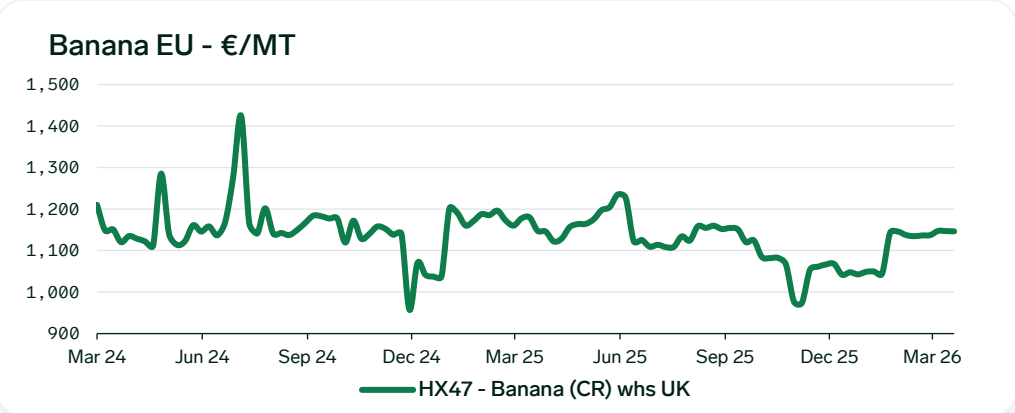
The average weekly price of Argentinian Pear as of March 25 decreased by 26.2% MOM and rose by 32.2% YOY to ARS 1,366.67/kg. According to market players, Argentina's 2026 pear season will see reduced production, as adverse weather conditions reduced crop yields. However, fruit quality is reportedly still good, and exports to Brazil, a key destination, are reportedly likely to benefit from reduced availability in Europe.

Oranges

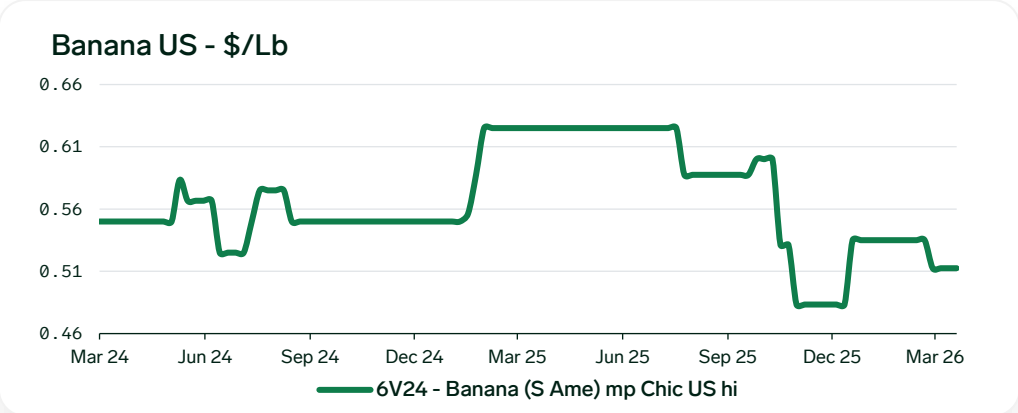


The average weekly price of South African Orange as of March 25 decreased by 46.5% MOM and declined by 32.2% YOY to ZAR 9,091.59/MT. The Citrus Growers' Association of Southern Africa (CGA) has released its initial export forecasts for 2026. Some orange varieties are expected to record declines in export volumes, while others, such as Valencia oranges, show slight increases. According to the CGA, the industry continues to face market access challenges, as well as logistical inefficiencies.

Banana

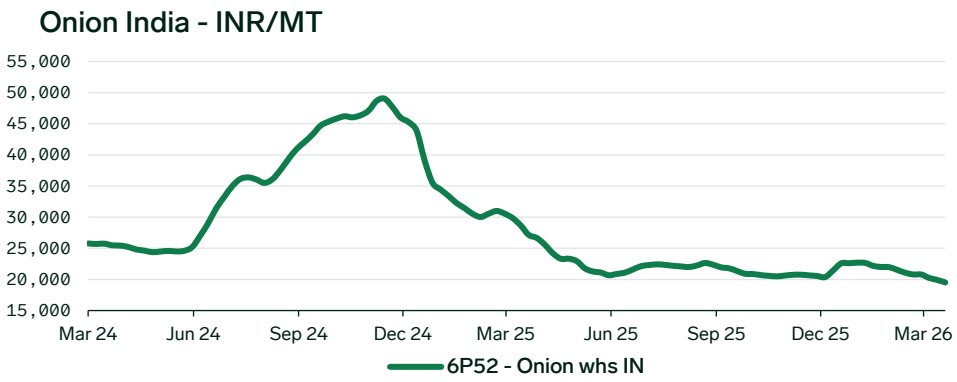


The average weekly price of EU Banana as of March 25 increased by 0.9% MOM and declined by 0.1% YOY to €1,146.33/MT. Market sources say the banana market continues to demonstrate stability overall as Costa Rica's banana production continues to produce consistent volumes. Still, some producers are expressing concern that tight margins have not kept up with growing labor and production costs. Meanwhile, FreshPlaza said the UK banana market experienced a decline in Belize banana imports in January, contradicting Belize's improved performance in other EU markets.

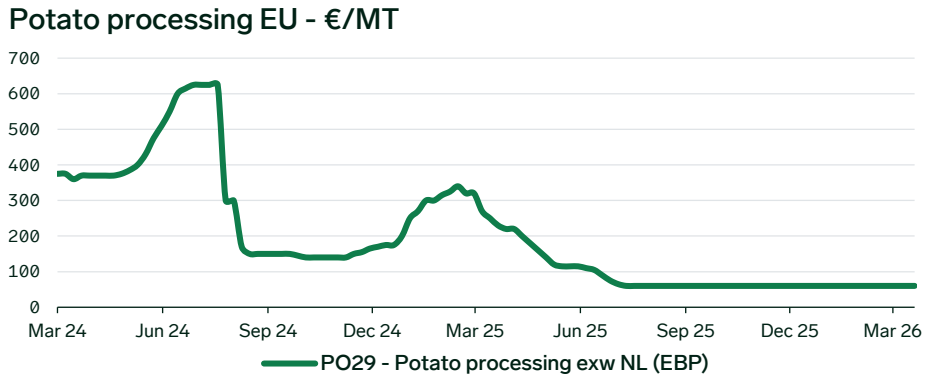


The average weekly price of US Banana as of March 25 decreased by 4.2% MOM and declined by 18.0% YOY to $0.51/Lb. US Banana prices slipped slightly amid solid supply from Costa Rica. Still, concerns around TR4, or Panama Disease, are front of mind as some South American crops are impacted. Meanwhile, banana exports to key UAE markets, such as Saudi Arabia, Oman, and Dubai, are largely paused due to the US-Isreal-Iran conflict, leaving supply available for alternative destinations.

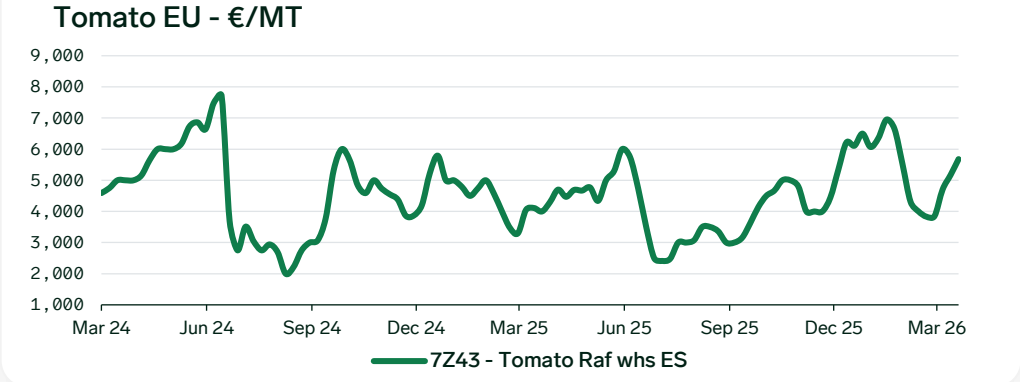
Expana



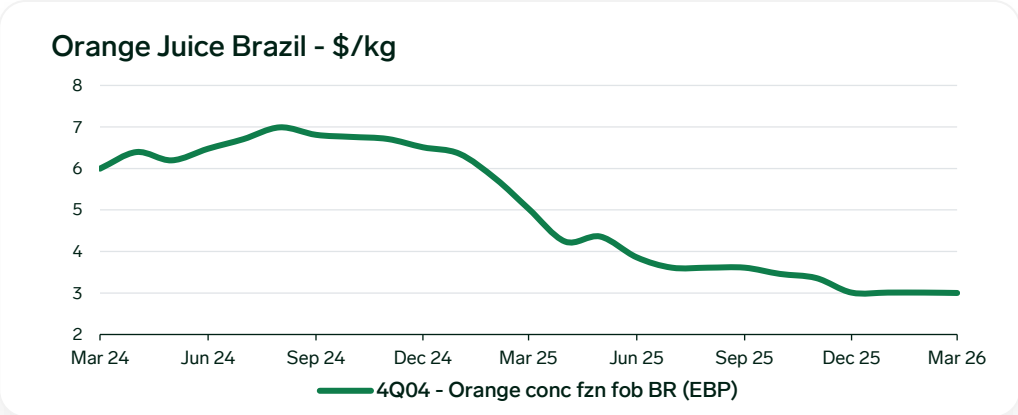
The average weekly price of Indian Onion as of March 25 decreased by 6.1% MOM and declined by 28.1% YOY to INR 19,516.10/MT. Indian onion prices have declined as exporters struggle with a lack of market access to the Gulf, owing to the Middle East conflict. According to market reports, exports to the region have decreased by close to 45% YOY. Freight prices for Indian exporters have increased exponentially, and sales opportunities are reportedly being lost to regional competitors who are able to access the market by road.



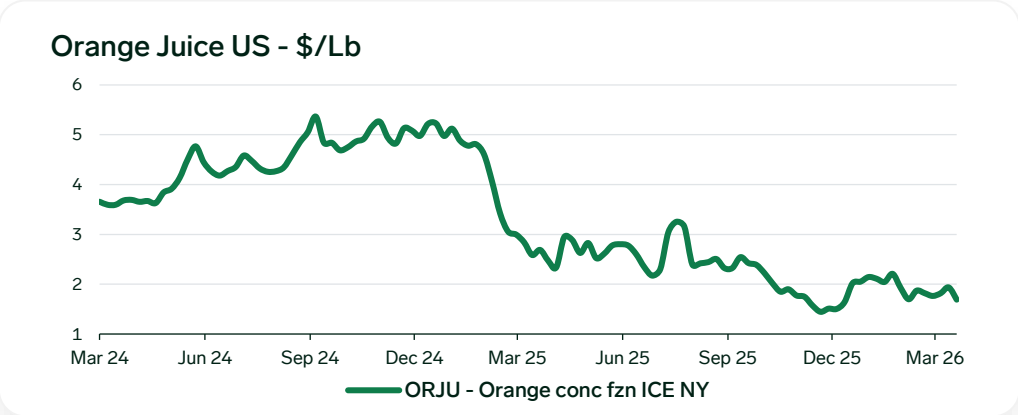
The average weekly price of EU Potato processing as of March 25 was unchanged MOM and declined by 73.9% YOY to €60/MT. Market participants describe a gloomy outlook for the sector, as the disruption to Gulf shipping and the resultant increase in freight costs add to an already difficult season for the industry. Vessels have been unable to reach their intended destinations, with sources reporting that some shipments have been returned to Europe. This comes amid the persistent oversupply situation in Europe, where free-buy trade continues to be reported at extremely low levels.



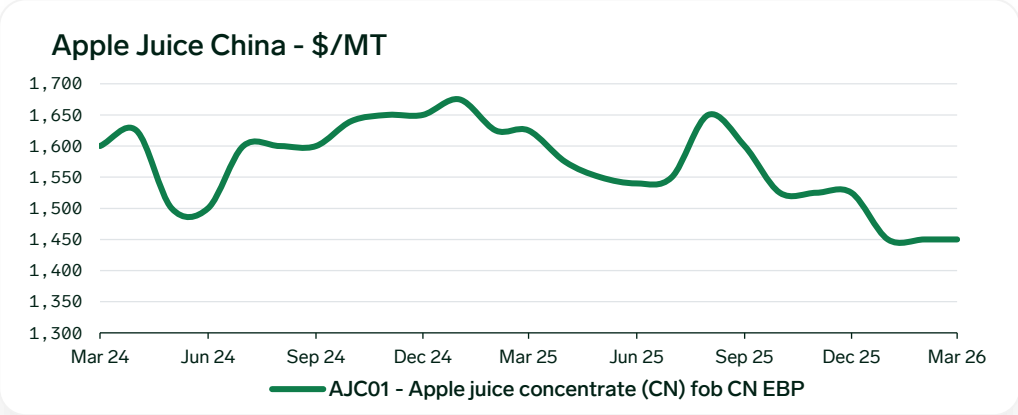
The average weekly price of EU Tomato as of March 25 increased by 48.3% MOM and rose by 42.0% YOY to €5,680/MT. Spanish tomato prices have increased significantly on the back of a supply shortage in Spain as well as other key producers such as Italy and Morocco. Severe weather events hit production in January and February, and stocks, which were at above-average levels, have been depleted significantly. Market sources expect the situation to persist throughout April.



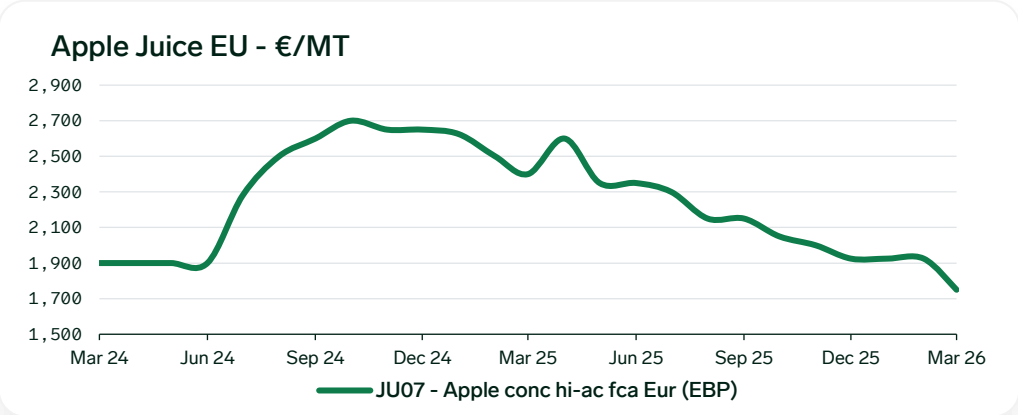
In March, the average price of Brazilian Orange Juice decreased by 0.3% MOM and declined by 40.4% YOY to $3/kg. The global orange juice market has slowed, according to market sources, as the ongoing Middle East conflict compels participants to adopt a cautious approach. Sources have told Expana that uncertainty around consumer purchasing is weighing on market sentiment



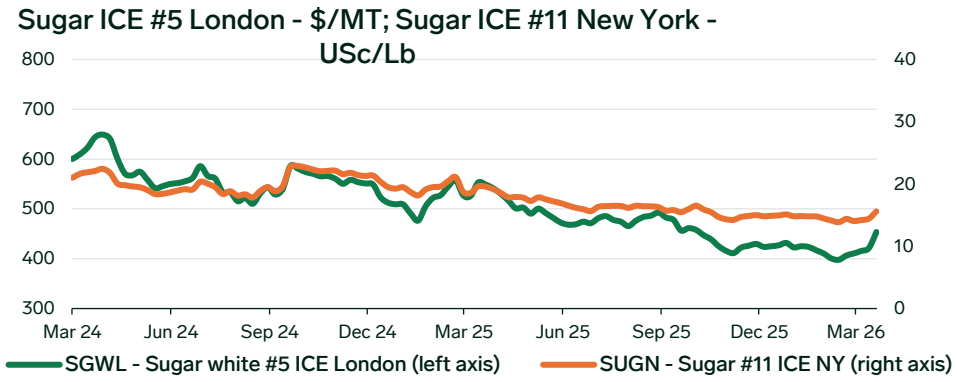
The average weekly price of US Orange Juice as of March 25 decreased by 7.1% MOM and declined by 37.1% YOY to $1.69/Lb. US futures prices have decreased as trade remains subdued and the market watches for an increase in demand. Supply levels are up YOY, while consumer purchasing continues to be below expectations in US and European markets.



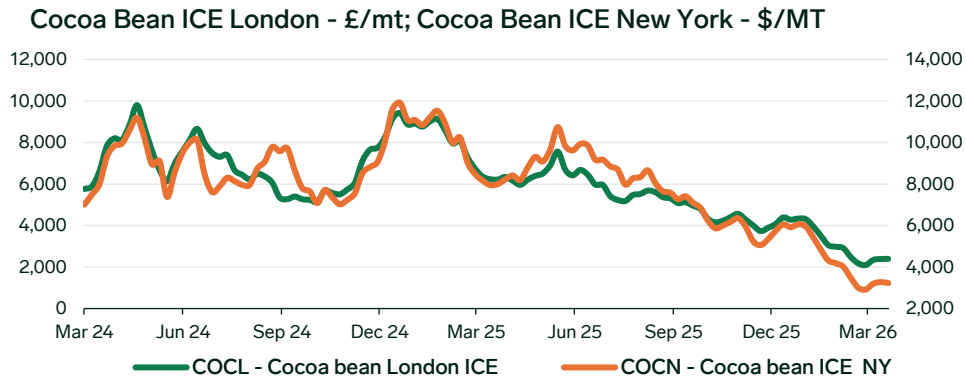
In March, the average price of Chinese Apple Juice was unchanged MOM and declined by 10.8% YOY to $1,450/MT. The 2025/26 apple season in China has ended with processors reportedly still holding a surplus of apple concentrate stocks. Market players said that China is facing sluggish demand for apple concentrate. Although some sources suggest that China recorded strong exports in 2025, they note that demand in key markets has largely been met, stating that "Europe and the US have obtained all their needs from China."



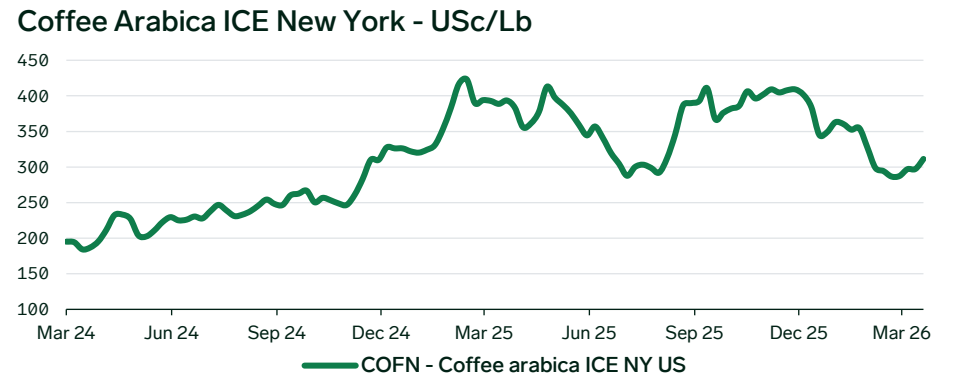
The average weekly price of EU Apple Juice as of March 25 decreased by 9.1% MOM and declined by 27.1% YOY to €1,750/MT. According to market sources, European trade has slowed and movement is below expectations. Sources added that stocks are still plentiful, weighing on prices. Processing in the Polish market was reportedly significantly below normal levels at the start of 2026, as buyers purchased smaller volumes.



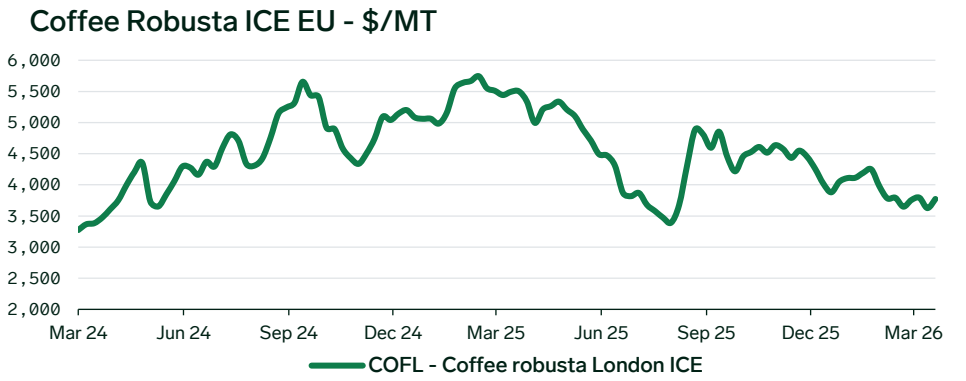
The average weekly spot price of ICE #11 Raw Sugar futures as of March 25 increased by 8.4% MOM and decreased by 20.3% YOY to USc 15.60/Lb. The average weekly price of spot ICE London #5 White Sugar futures as of March 25 increased by 11.6% MOM and decreased by 17.3% YOY to $453.58/MT. World sugar prices found support from the Middle East conflict in March, with the front-month raw sugar contract breaking out of February's USc 14.00–15.00/lb range and testing USc 16.00/lb by month-end. Rising global oil prices from the conflict have pushed up production and logistics costs and reinforced expectations of a domestic gasoline-price increase in Brazil, which would support ethanol parity.



The average weekly spot price of ICE London Cocoa futures as of March 25 increased by 10.0% MOM and decreased by 61.5% YOY to £2,393.40/MT, while the average weekly spot price of ICE New York Cocoa futures as of March 25 increased by 7.5% MOM and decreased by 59.6% YOY to $3,226.80/MT. Cocoa prices rallied in March. London second-month prices rose to a six-week high of £2,512/mt, 22% higher than at the previous month-end. In New York, prices rose to US$3,367/mt, US$479 (17%) higher than at end-February. Prices in both London and New York remain about 57% lower YOY. The arbitrage (New York–London) on the second position widened from US$115 at end-February to US$135 at end-March.

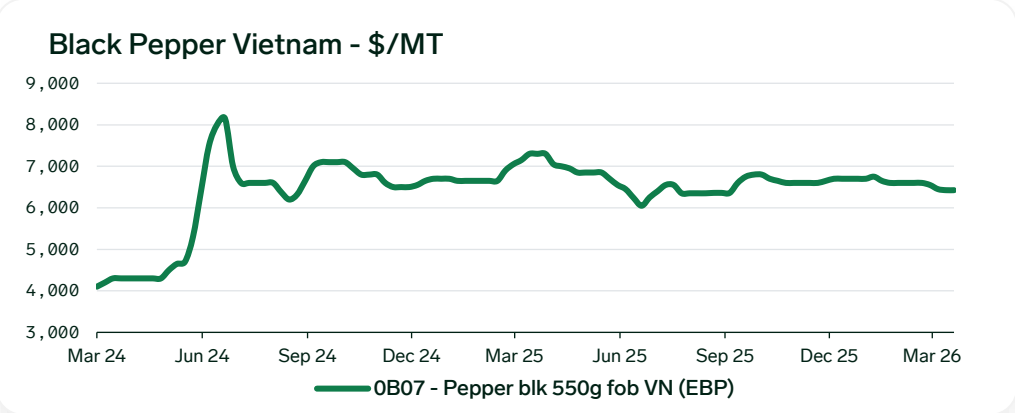


The average weekly spot price of ICE New York Arabica futures as of March 25 increased by 8.6% MOM and decreased by 20.9% YOY to USc 311.38/Lb. Arabica certified stocks continued to build as coffee moved from origin to the exchange. In New York, arabica certified stocks rose by 47,300 bags in March 2026 to 557,500 bags, 10% higher than at end-February but about 0.2 million bags lower YOY. Stocks originating in Honduras increased by 44,000 bags, while stocks from Brazil fell by 7,500 bags.

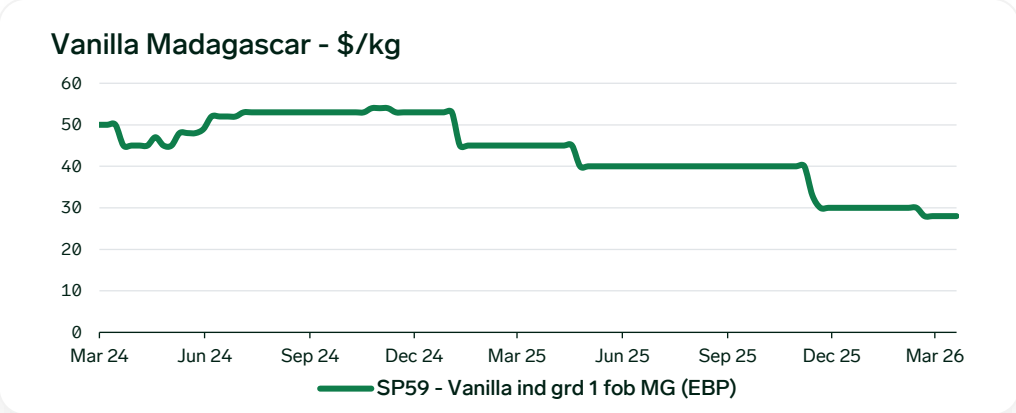


The average weekly spot price of ICE London Robusta futures as of March 25 increased by 3.4% MOM and decreased by 31.4% YOY to $3,772.80/MT. In London, robusta certified stocks were drawn down in March, falling by 90,800 bags to 682,200 bags, 6% lower YOY. Weather across Vietnam's Central Highlands was seasonally dry in the last 10 days of March, with light showers in Dak Nong. Cumulative precipitation since the start of 2026 is 1% below normal in Dak Lak, 56% above normal in Dak Nong, 17% above normal in Lam Dong and 25% above normal in Gia Lai.

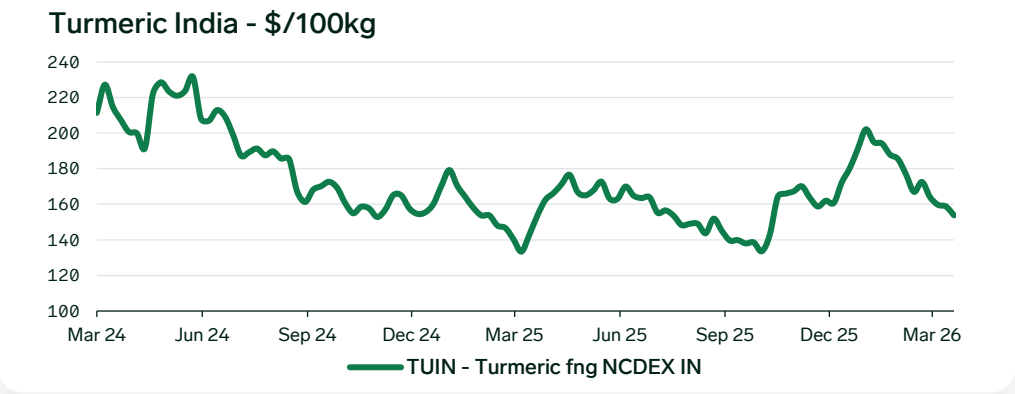
Expana



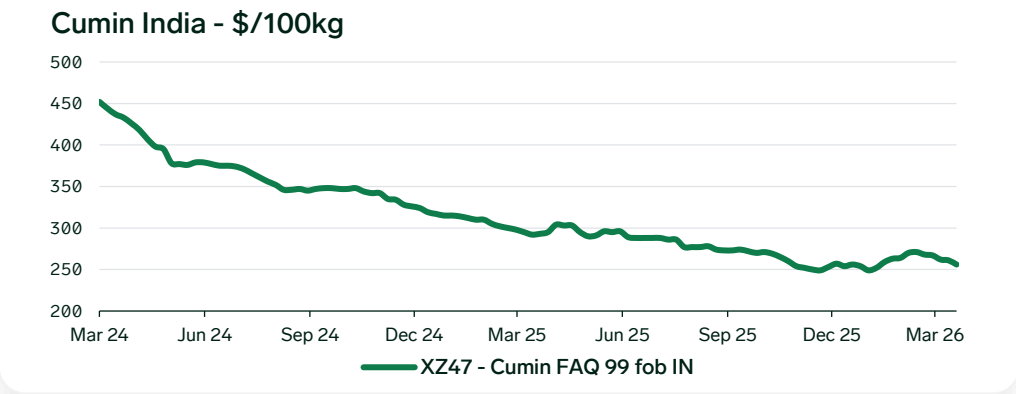
The average weekly price of Vietnamese Black Pepper as of March 25 decreased by 2.7% MOM and declined by 12.0% YOY to $6,425/MT.



The Expana Benchmark Prices (EBP) of vanilla from Madagascar, the world's largest producer, were unchanged MOM in March, down 37.8% YOY, at $28/kg for industrial grade 1 extraction vanilla beans. Prices continue to be pressured by oversupply.



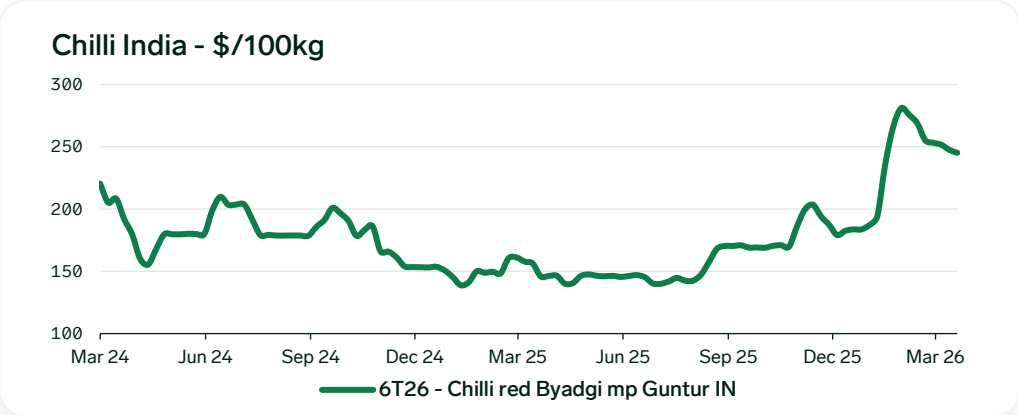
The average weekly price of Indian Turmeric as of March 25 decreased by 10.9% MOM and declined by 0.0% YOY to $153.74/100kg.



The average weekly price of Indian Cumin as of March 25 decreased by 4.5% MOM and declined by 12.6% YOY to $256/100kg.

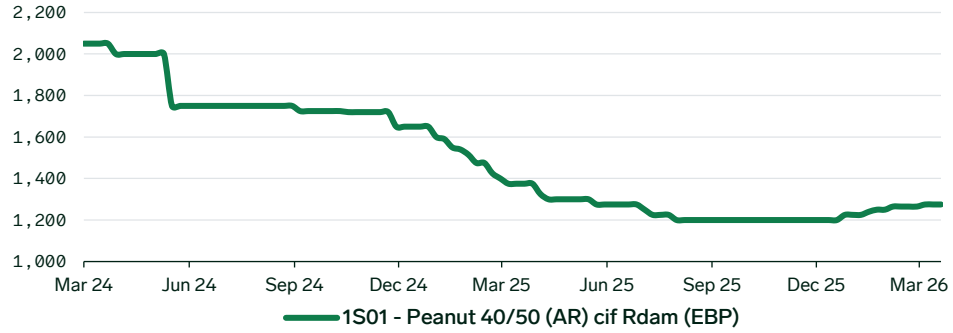
Herbs & Spices

Chilli



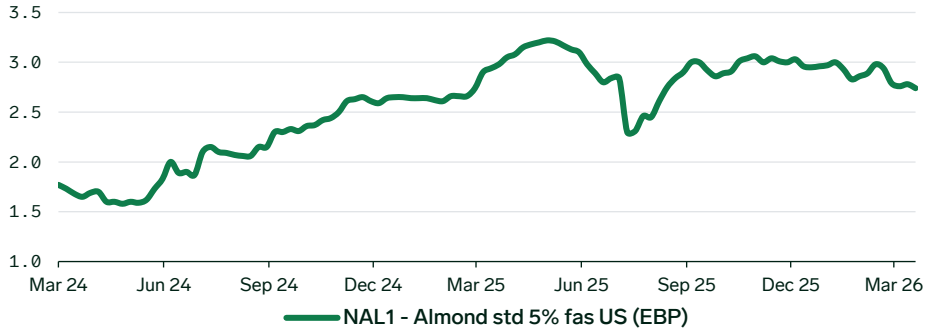
The average weekly price of Indian Chilli as of March 25 decreased by 3.9% MOM and rose by 68.1% YOY to $245.20/100kg.

Peanuts Argentina - $/MT



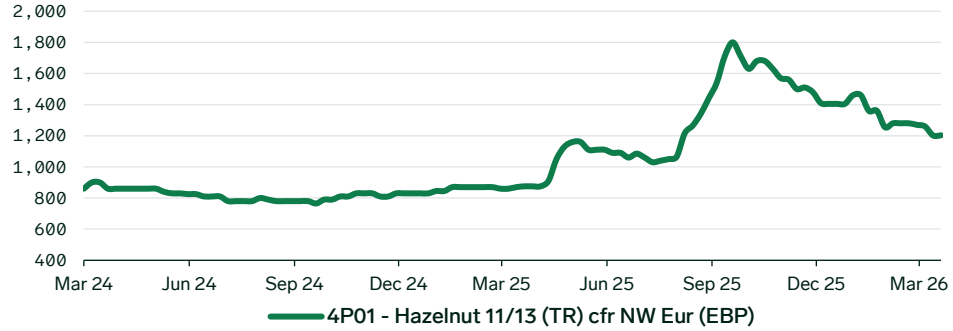
The average weekly price of Argentinian Peanuts as of March 25 increased by 0.8% MOM and declined by 7.3% YOY to $1,275/MT. Argentine peanut prices have largely stabilized following recent gains driven by new-crop drought stress. Relief rains across the growing region have eased near-term concerns, though yield potential has been reduced. With lower planted acreage and dry conditions, industry sources expect a smaller crop than the prior year, though production should still reach historically large levels. Harvest-season weather will likely influence pace and near-term pricing as the market transitions crop years. Freight and energy cost pressures continue to weigh on producers but have not yet materially impacted market prices.

Almonds US - $/Lb



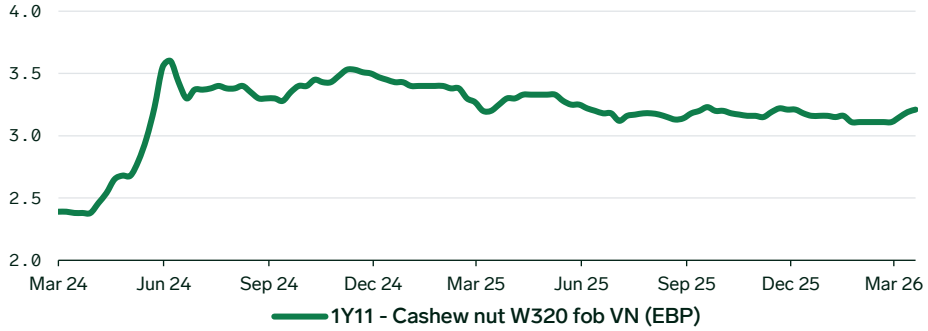
The average weekly price of US Almonds as of March 25 decreased by 6.8% MOM and declined by 8.1% YOY to $2.74/Lb. US almond prices declined early in March amid Middle East uncertainty, then stabilized and traded rangebound through month-end. Despite significant global and macroeconomic headwinds, demand has remained relatively resilient, though market participants are closely monitoring this dynamic. Attention will focus on late April/early May crop estimates for 2026/27, with industry observers expecting the outlook to influence current pricing as end-users factor future supply availability into coverage decisions for the remainder of the year.

Hazelnuts Turkey - $/100kg



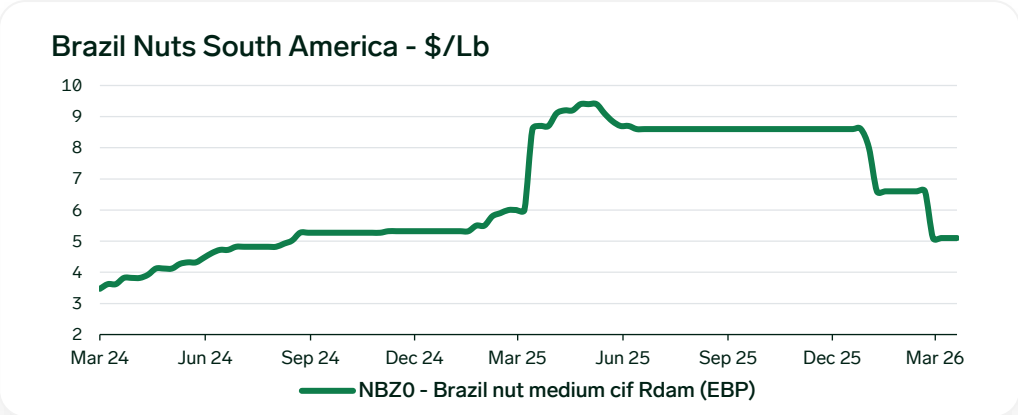
The Turkish hazelnut EBP (11/13 CFR EU) decreased by 6% MOM in March to $1,203/100kg, and rose by 37.5% YOY. Turkey's 2025/26 hazelnut crop fell 34% YOY to 518,000 MT, the lowest in recent years, due to spring frosts and summer droughts. The 2026/27 season crop outlook appears more promising, with projections exceeding 800,000 MT. Carryover inventory from the current 2025/26 campaign could exceed 100,000 MT due to slow demand.

Cashews Vietnam - $/Lb

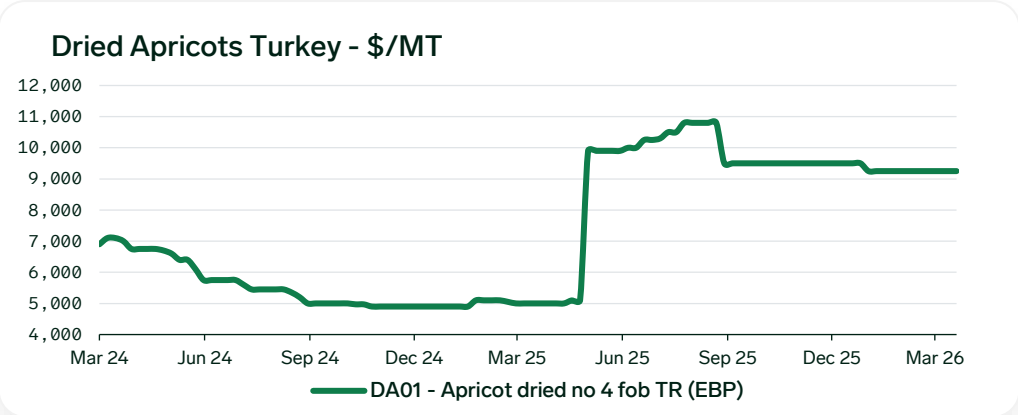


The Vietnamese cashew nut EBP increased by 3.2% MOM in March to $3.21/lb, down 1.2% YOY. Despite some forward interest, majority of buying from Vietnam continues to be done for nearby positions due to uncertain market outlook. On the European spot market, demand for WW320 remained slow, several sources said. Larger-sized kernels, by contrast, were experiencing brisk demand.

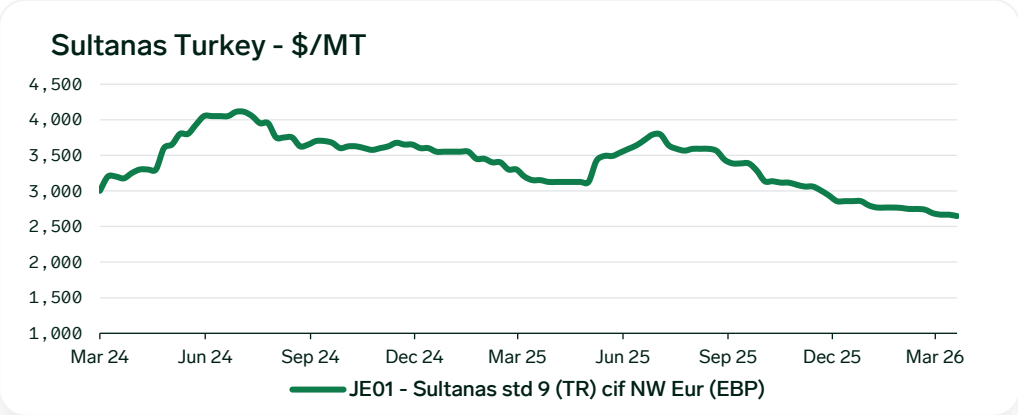
Brazil nuts, dried apricot & sultanas



The Brazil nut EBP decreased by 22.7% MOM in March to $5.5/lb, down 41.4% YOY. Prices have fallen YOY as new supply from South America enters the market.

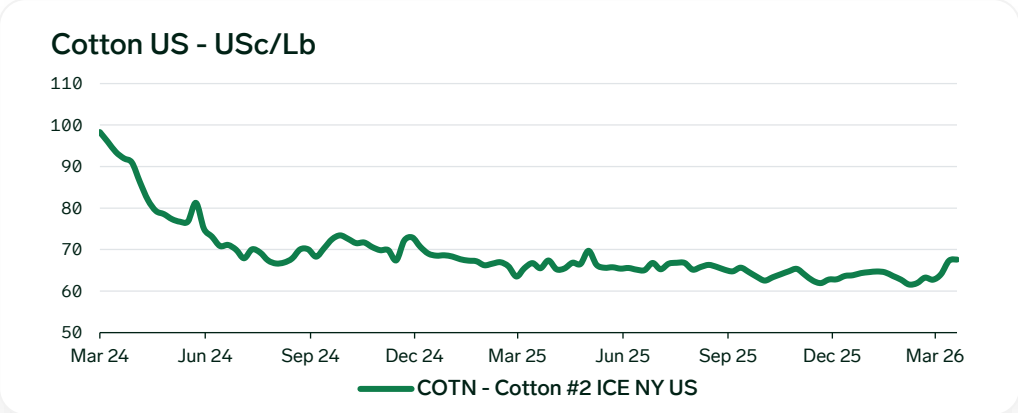


Turkish dried apricot prices were unchanged MOM in March at $9,250/MT, up 85% YOY. Offers are scarce as whole fruit quality from the 2024 harvest deteriorates. Turkey's dried apricot sector experienced a severe collapse in 2025/26, with the output plummeting 98.1% to just 2,000 MT (March INC data), due to April 2025 frosts. However, recent assessments offer some recovery prospects. Experts project recovery rates of 60–80% of normal yields for the 2026 harvest. Trees have passed the flowering phase, and crop conditions remain favorable so far.

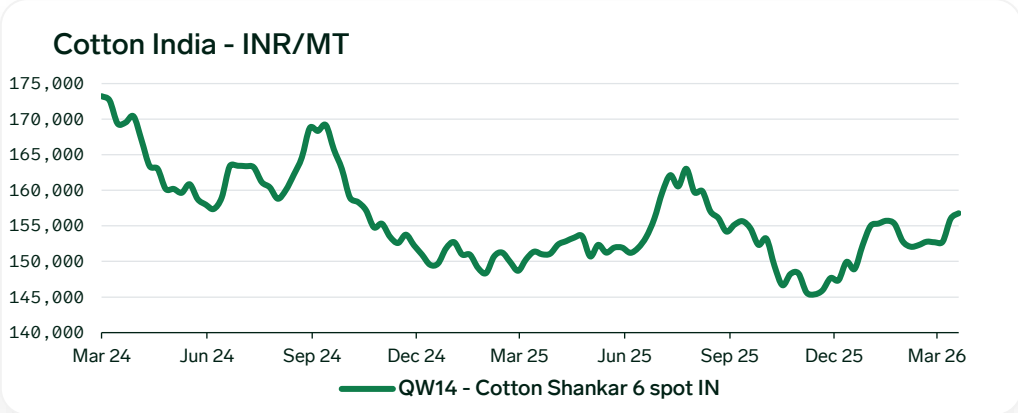


The Turkish sultana EBP (CIF Northwest Europe) fell by 3.3% MOM in March, down 16% YOY, to $2,647/MT. According to a new March 2026 production forecast revision from the International Nut and Dried Fruit Council (INC), Turkey's dried fruit sector faced a historic setback in 2025/26, with sultana production collapsing 27% to 165,000 MT following a devastating 2025 April frost. The revised estimate represents a substantial downward revision from a previous forecast of 220,000 MT. In normal years, Turkey can produce in excess of 300,000 MT. Despite the production shortfall, prices have been easing, pressured by weak global demand.

Cotton

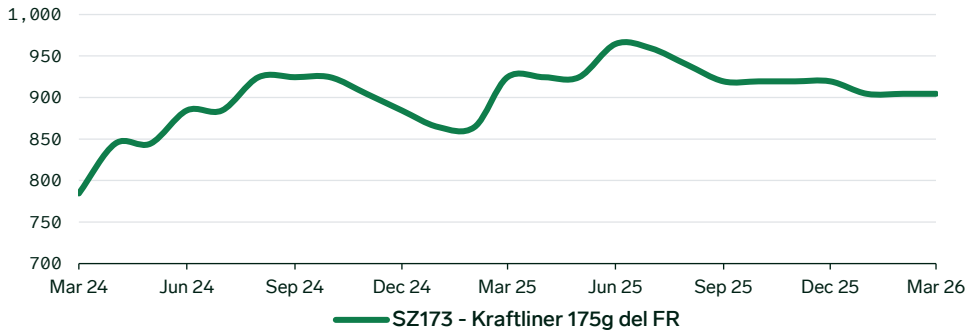


The average weekly price of US Cotton as of March 25 increased by 6.9% MOM and rose by 3.2% YOY to USc 67.59/Lb. Prices for cotton in the US rose in March due to concerns about severe drought in Texas and other key growing regions, which threatens the 2026 harvest and could lead to a reduction in planted acreage.



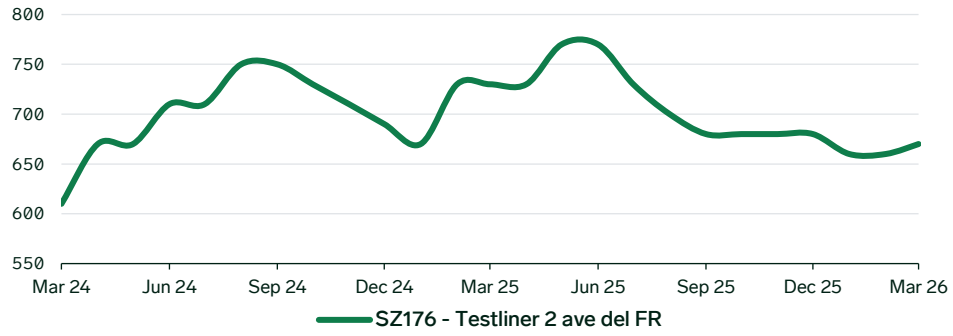
The average weekly price of Indian Cotton as of March 25 increased by 2.6% MOM and rose by 3.8% YOY to INR 156,772.34/MT. Cotton prices in India rose in March driven by strong demand from spinning mills and traders against the backdrop of overall increases in global quotations. A significant impact was exerted by the weakening of the Indian rupee against the dollar, which made cotton imports more expensive and stimulated purchases on the domestic market.

Kraftliner EU - €/MT



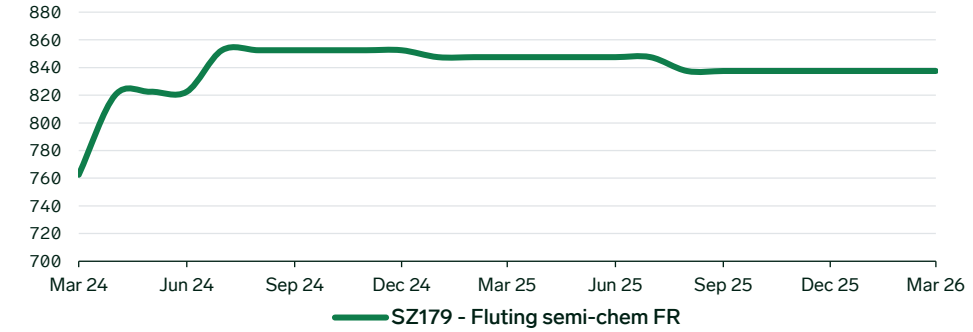
In March, the average price of EU Kraftliner was unchanged MOM and declined by 2.2% YOY to €904.50/MT. Weak demand prevented suppliers from raising prices despite rising raw material costs for kraftliner production. Paper manufacturers in the EU faced a 2.2% MOM increase in NBSK pulp prices in March, but market sources were primarily concerned about hardwood pulp prices, which rose 39% MOM due to low supply. In the global market, suppliers redirected pulp to Asia where demand was higher. In Europe, strikes at Spanish facilities and storms in Spain and Portugal disrupted supply, particularly for hardwood pulp.

Testliner EU - €/MT



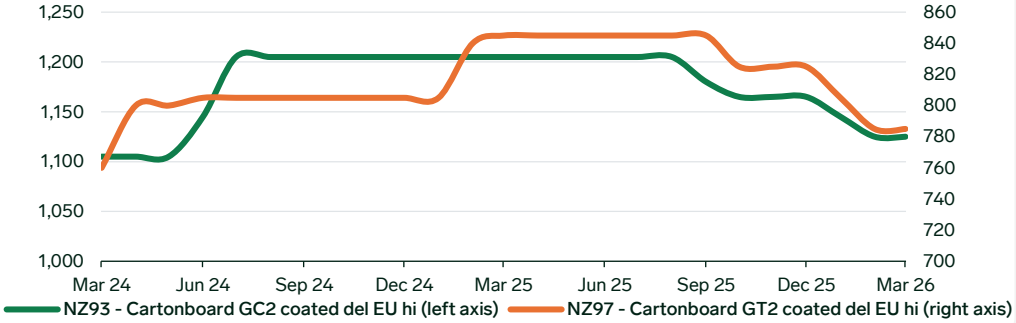
In March, the average price of EU Testliner increased by 1.5% MOM and declined by 8.2% YOY to €670/MT. Demand for testliner was stronger than for kraftliner and suppliers managed to raise prices slightly. Waste paper prices did not change significantly, but energy costs, particularly natural gas, rose sharply, pushing prices higher.

Fluting EU - €/MT

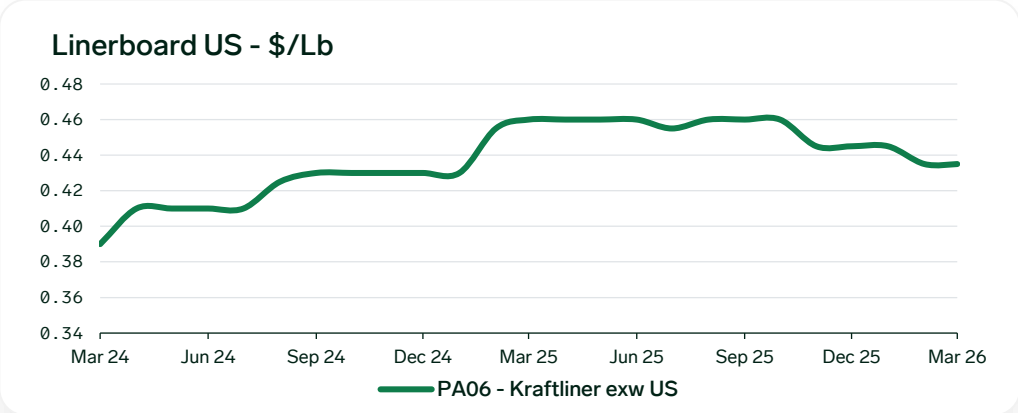


In March, the average price of EU Fluting was unchanged MOM and declined by 1.2% YOY to €837.50/MT. Prices remained stable as supply and demand were in balance. At the same time, some sources indicated that further price increases were being discussed with suppliers amid rising energy costs.

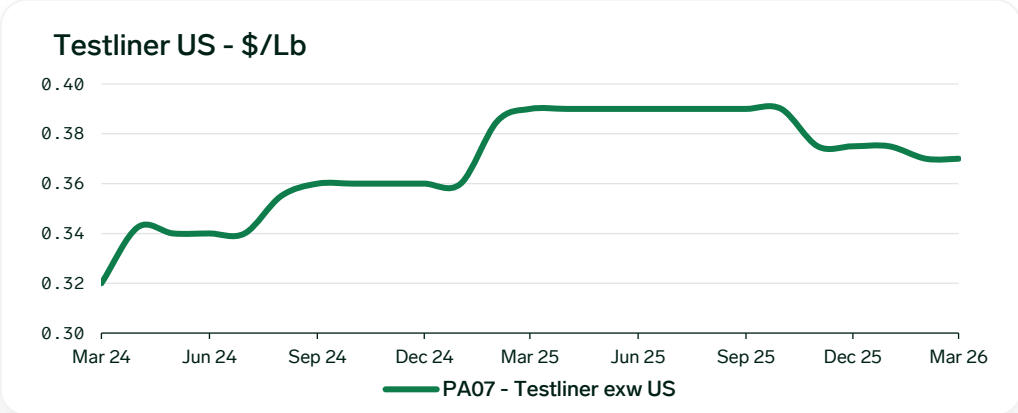
Cartonboard EU - €/MT



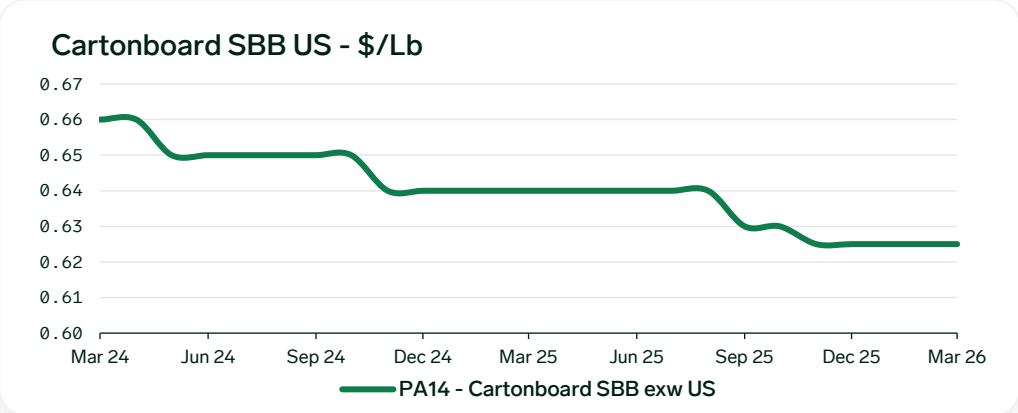
In March, the average price of EU Cartonboard GC2 was unchanged MOM and declined by 6.6% YOY to €1,125/MT, the average price of EU Cartonboard GT2 was unchanged MOM and declined by 7.1% YOY to €785/MT. Stabilization of cartonboard prices in March was explained by a balanced market, with moderate demand from food and consumer packaging manufacturers fully matching available supply volumes. Additionally, intense competition among European producers and excess capacity in the cartonboard segment continued to restrain price growth.



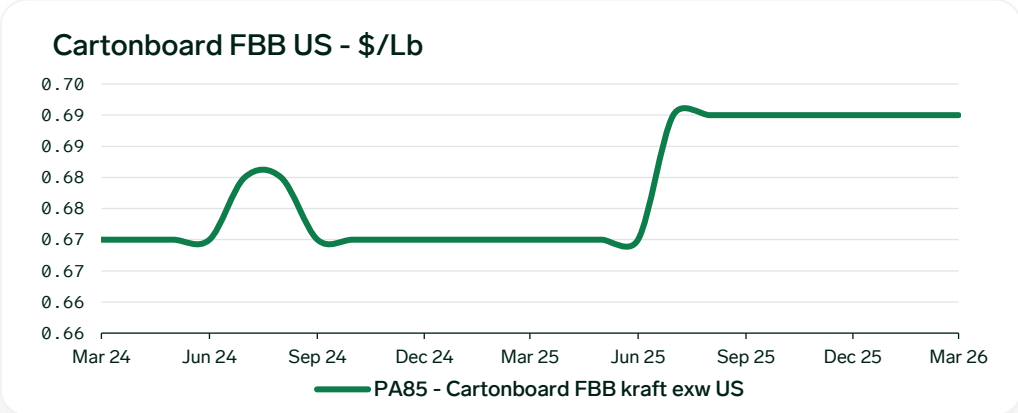
In March, the average price of US Linerboard was unchanged MOM and declined by 5.4% YOY to $0.44/Lb. Kraftliner prices were steady in March despite the PCA price increase of $70/mt that took effect on March 1. Market contacts suggest buyer resistance has so far limited adoption of the announced increase, with transaction prices holding at prior levels.



In March, the average price of US Testliner was unchanged MOM and declined by 5.1% YOY to $0.37/Lb. Testliner prices held flat in March as input costs such as OCC remained relatively stable during the month, offering some respite to producers after a period of upward pressure.

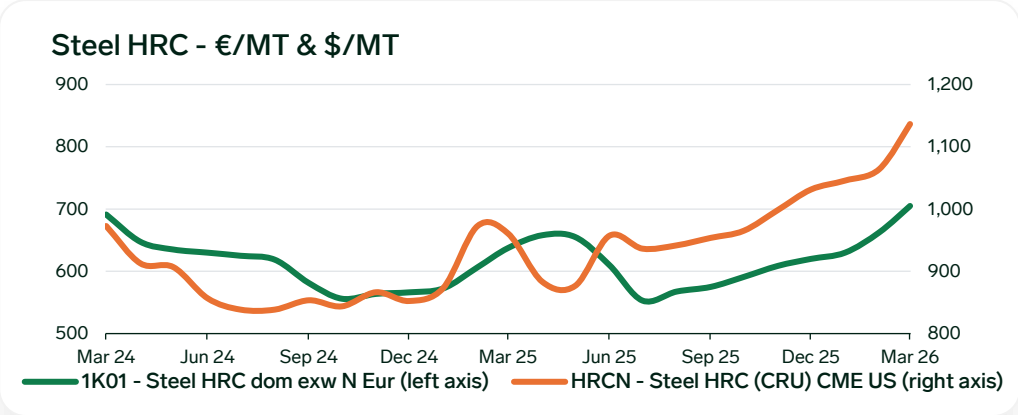


In March, the average price of US Cartonboard SBB was unchanged MOM and declined by 2.3% YOY to $0.63/Lb. Cartonboard pricing has now been flat since November, when the divergence that began in July came to a halt as volumes declined.

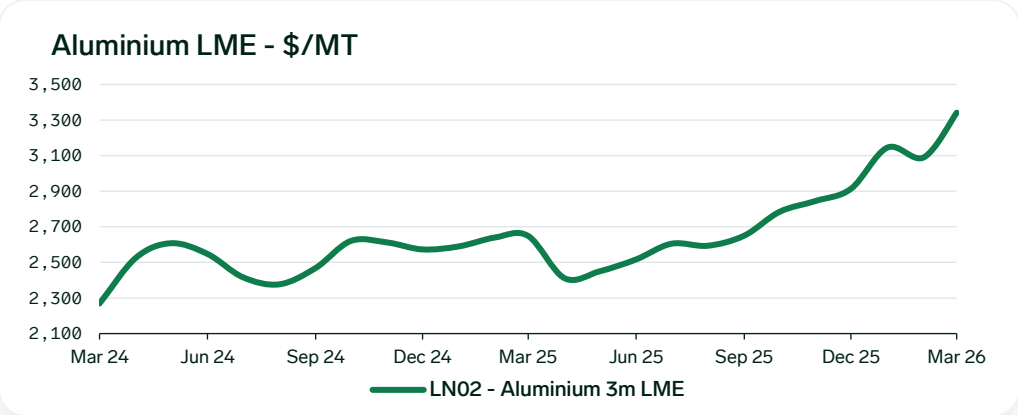


In March, the average price of US Cartonboard FBB was unchanged MOM and rose by 3.0% YOY to $0.69/Lb. Prices for FBB kraft were unchanged in March as the market continued to absorb producer price adjustments. Demand for non-recycled cartonboard remained soft according to market contacts.

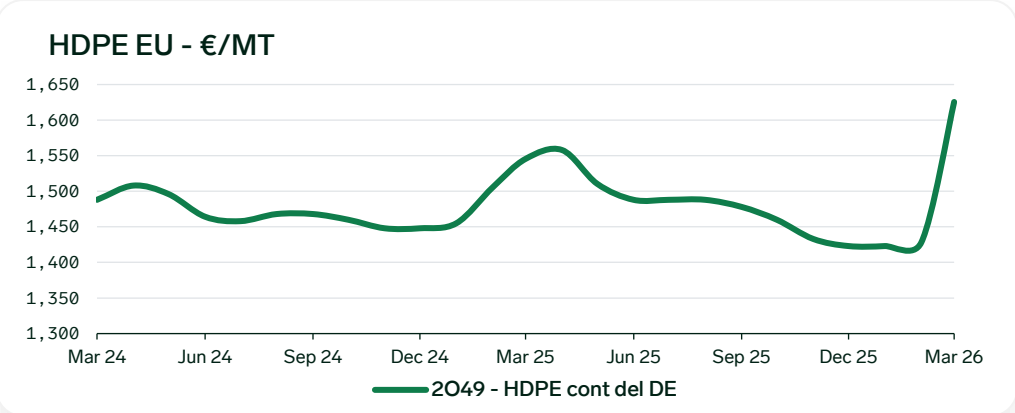
Steel & Aluminium



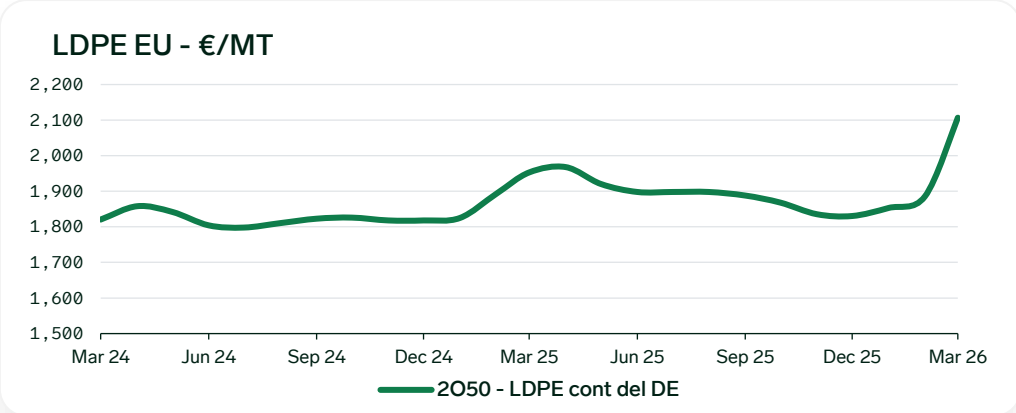
In March, the average 3-month (3m) futures price of US HRC steel CME increased by 6.8% MOM and rose by 18.3% YOY to $1,136.53/MT. The average price of EU steel HRC increased by 6.4% MOM and rose by 10.6% YOY to €705/MT. Overall demand for steel remained weak, but against the backdrop of tariffs and the Carbon Border Adjustment Mechanism (CBAM), demand for steel produced in the US and EU continued to grow, allowing producers to raise prices. Iron ore and coke prices in China rose as consumers resumed purchases following the conclusion of Lunar New Year celebrations. Risks of reduced iron supply from Iran stimulated inventory accumulation. Steel scrap prices continued their steady rise.



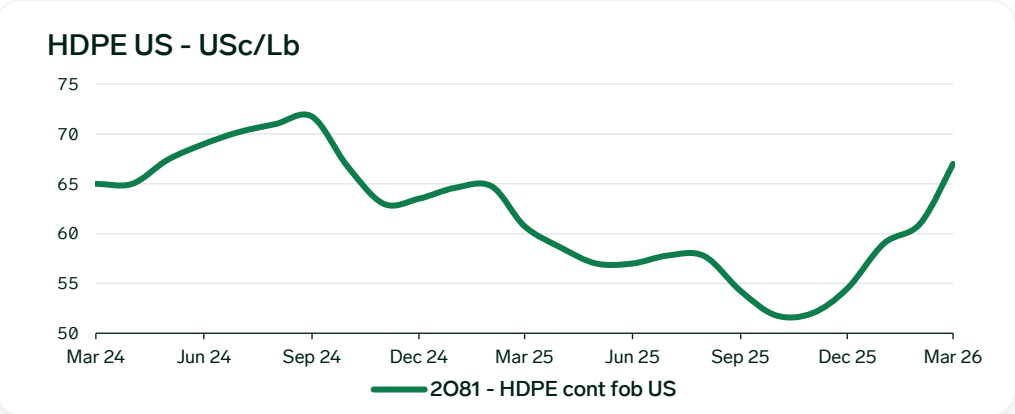
In March, the average 3m futures price of LME Aluminium increased by 8.1% MOM and rose by 26.1% YOY to $3,341.64/MT. Base metals prices on the London Metal Exchange (LME) declined in March against risks of consumption contraction. Only aluminium prices continued their rise, as military activity in the Middle East further reduced supply on a deficit market.



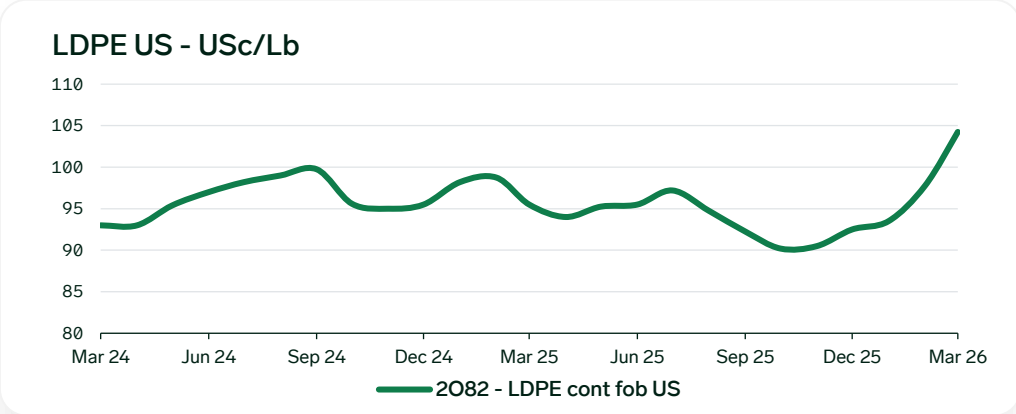
In March, the average price of EU HDPE increased by 13.8% MOM and rose by 5.2% YOY to €1,625.50/MT. Prices moved upwards markedly throughout March due to growing supply issues caused by the war in the Middle East. Additionally, major price rises in the naphtha market added upward momentum to ethylene prices. Sentiment within the European plastics market is reportedly 'firm' according to market sources, who remain worried about the supply of feedstocks and the increase in production costs due to markedly higher crude oil prices.



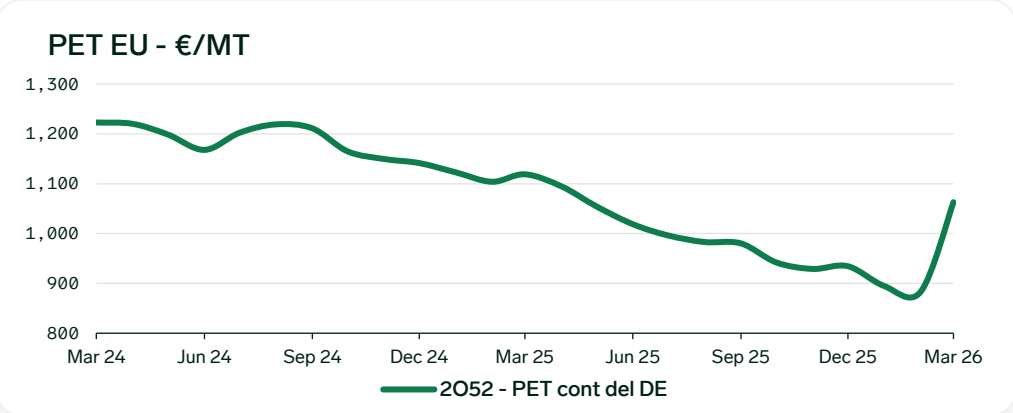
In March, the average price of EU LDPE increased by 11.7% MOM and rose by 7.9% YOY to €2,106.75/MT. Prices for all plastic products in Europe rose markedly throughout March, driven by major worries associated with the ongoing Middle East conflict. Demand for polyethylene improved marginally with the coming of the spring.



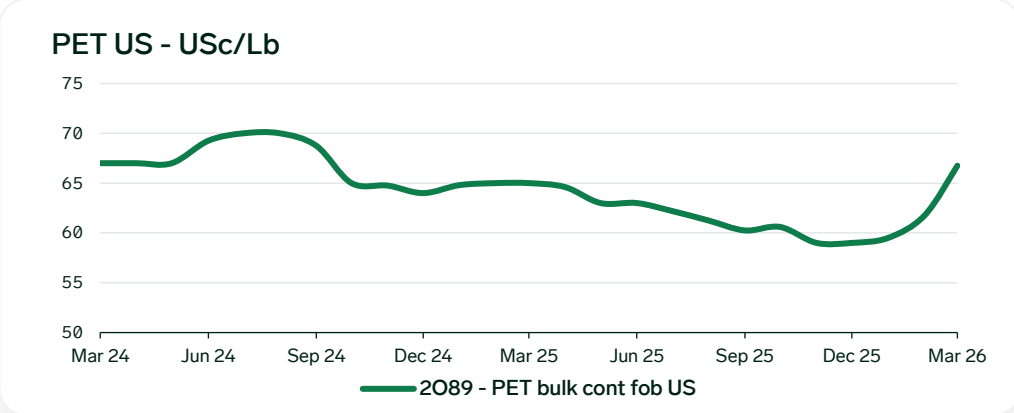
In March, the average price of US HDPE increased by 9.8% MOM and rose by 10.3% YOY to USc 67/Lb. Throughout March, plastic products prices in the US moved upwards in line with continued supply concerns attributable to the US-Iran War, and the associated shipping disruption. Like in Europe, several buyers reported fixing purchases at elevated levels to manage risk associated with the war and the potential for continued volatility in feedstock prices.



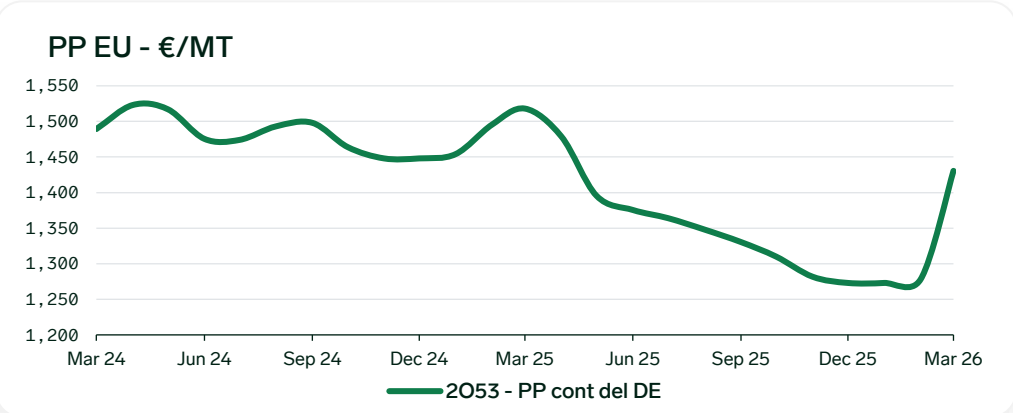
In March, the average price of US LDPE increased by 6.6% MOM and rose by 9.2% YOY to USc 104.25/Lb. Rising raw material prices have steadily driven up plastic prices. The sentiment for the US plastics market moves from 'steady' to 'mildly firm' due to the ongoing Middle East conflict, which is pushing global plastics prices higher.



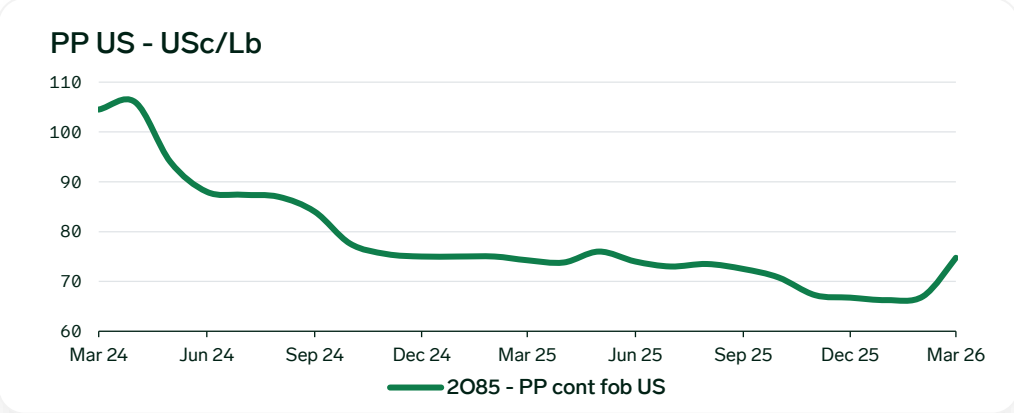
In March, the average price of EU PET increased by 20.4% MOM and declined by 5.0% YOY to €1,063/MT. In addition to significant rises in raw material prices in Europe, demand for polyethylene and PET improved marginally with the coming of spring.



In March, the average price of US PET increased by 8.1% MOM and rose by 2.7% YOY to USc 66.75/Lb. Paraxylene prices spiked throughout the month due to the impact of the US-Iran War, which pushed production costs upwards. Demand is also rising in advance of the peak season as producers prepare for increased PET production. Market sources noted a rise in demand ahead of the peak season for PET production in spring and summer.



In March, the average price of EU PP increased by 11.9% MOM and declined by 5.8% YOY to €1,430.50/MT. Propylene prices rose notably throughout March, attributable to the ongoing Middle East conflict and a resulting tightened market. As a result, PP prices increased significantly, supporting global plastic price growth.



In March, the average price of US PP increased by 11.6% MOM and rose by 0.7% YOY to USc 74.75/Lb. Although the latest data on plastic production indicate a slight decline, industry sources believe that production volumes are likely to increase in response to rising demand, although growth in demand for PP is expected to be moderate.
