Maize CBOT - $/MT

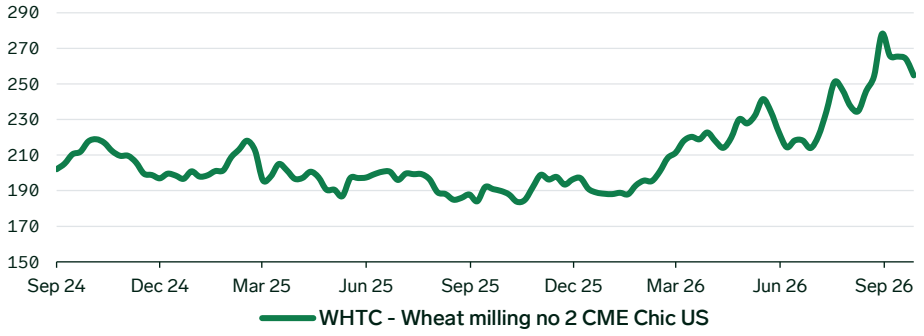

The average weekly price of CBOT Maize as of September 30 increased by 5.4% MOM and rose by 22.7% YOY to $204.78/MT. Market players linked the 5.4% month-on-month increase to tighter US and global supply expectations, with USDA cutting US production by 5.42 million mt as yields were revised lower. Sources added that global consumption is expected to exceed production by around 22 million mt, while further rainfall could temporarily slow the US harvest and delay physical availability. Harvest progress and South American weather remain key watchpoints into October.

Maize Euronext - €/MT

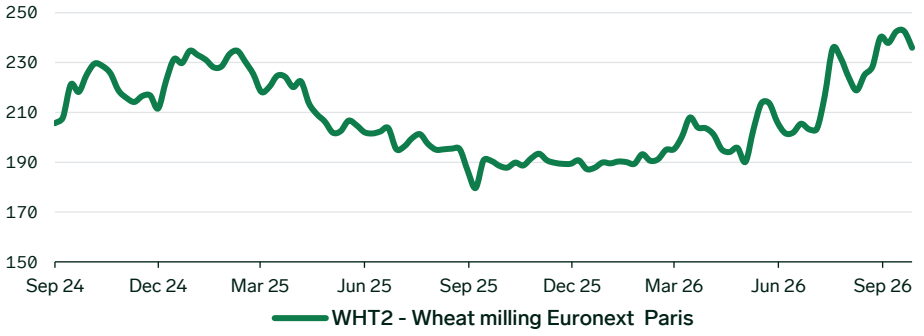

The average weekly price of Euronext Maize as of September 30 increased by 2.6% MOM and rose by 43.8% YOY to €268.95/MT. Sources attributed the 2.6% month-on-month increase to a weaker European crop outlook and continued Black Sea logistical disruption. USDA forecasts EU production at 50.6 million mt, down 10.9% year-on-year, increasing reliance on imports, while constrained Ukrainian export routes continue to limit nearby availability. Market players said EU import demand and the ability of Ukrainian grain to move through alternative routes will remain important price drivers.

Wheat CBOT - $/MT

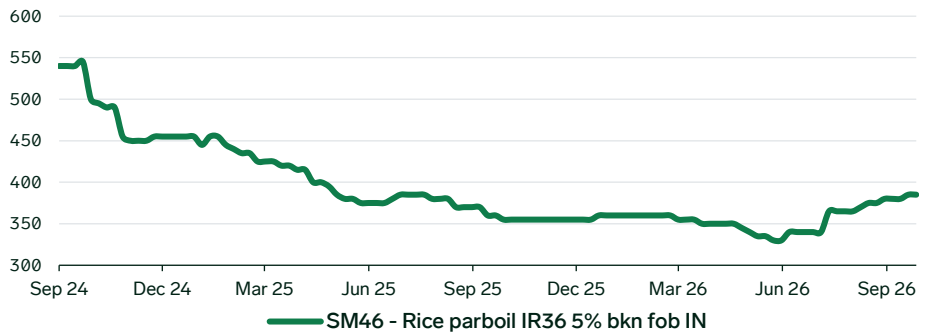

The average weekly price of CBOT Wheat as of September 30 increased by 0.2% MOM and rose by 33.5% YOY to $254.81/MT. Market players said the 0.2% month-on-month increase reflected continued Black Sea supply risks and a slower start to US winter wheat planting, with only 17% of planned area sown by end-September versus the five-year average of 21%. However, ample global supply capped gains, with USDA raising 2026/27 world production to 822.43 million mt. US planting conditions and Black Sea logistics remain key watchpoints into October.

Wheat Euronext - €/MT

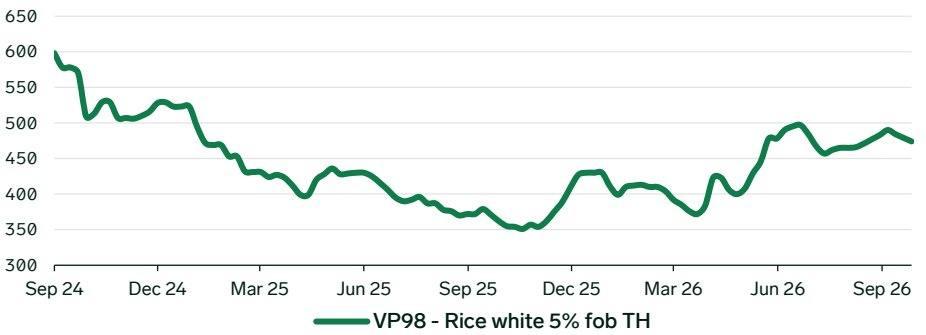

The average weekly price of Euronext Wheat as of September 30 increased by 3.3% MOM and rose by 23.9% YOY to €235.95/MT. Sources linked the 3.3% month-on-month increase to a weaker EU crop outlook and continued disruption to Black Sea exports. USDA lowered EU production to 133.8 million mt, down 7.8% year-on-year, while congestion at Constanța and constrained Russian and Ukrainian export routes continued to raise logistics costs. Market players said European import demand and Black Sea execution will remain key price drivers.

Rice India - $/MT

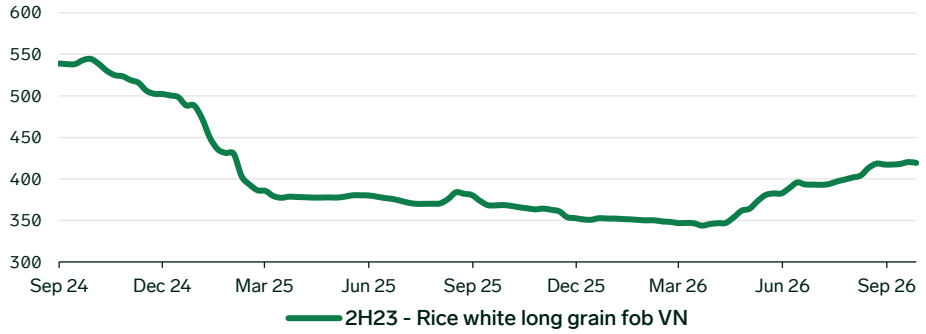

The average weekly price of Indian Rice as of September 30 increased by 2.7% MOM and rose by 6.9% YOY to $385/MT. Market players linked the 2.7% month-on-month increase to tightening new-crop expectations after below-normal monsoon rainfall reduced yield potential. Industry estimates suggest India's 2026 rice crop could fall by around 10 million mt year-on-year, while export prices reached their highest level in more than a year during September. Looking ahead, record government stocks should limit upside and maintain export availability despite the smaller crop.

Rice Thailand - $/MT

The average weekly price of Thai Rice as of September 30 decreased by 0.6% MOM and rose by 27.8% YOY to $474/MT. Sources attributed the 0.6% month-on-month decline to softer buying interest toward the end of September and improving seasonal availability. Thai 5% broken rice eased from around $490/mt FOB on September 9 to $474/mt by September 30, suggesting earlier supply concerns were losing momentum. New-crop availability and export demand will remain the main watchpoints.

Rice Vietnam - $/MT

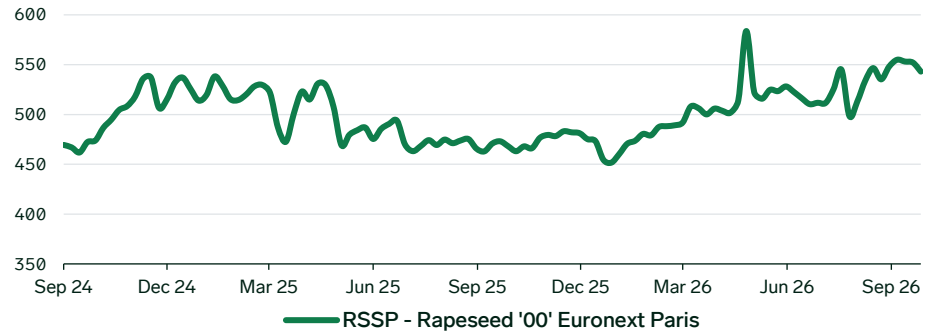

The average weekly price of Vietnamese Rice as of September 30 increased by 0.2% MOM and rose by 13.9% YOY to $419.30/MT. Vietnamese rice prices were broadly stable, increasing just 0.2% month-on-month as tightening summer-autumn availability offset subdued export demand. Market reporting showed summer-autumn supply declining toward month-end, while trading remained slow and export prices softened slightly across some grades. Sources said overseas demand and the arrival of autumn-winter supply will be key to determining clearer price direction.

Oilseeds and Vegetable Oils

Rapeseed & Rapeseed Oil

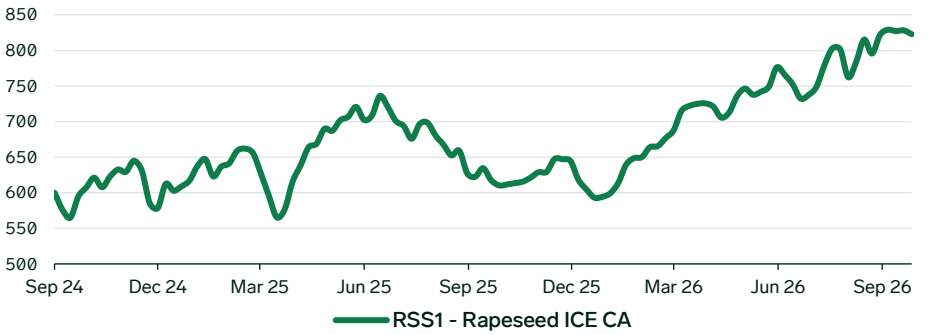

Expana

Rapeseed EU - €/MT

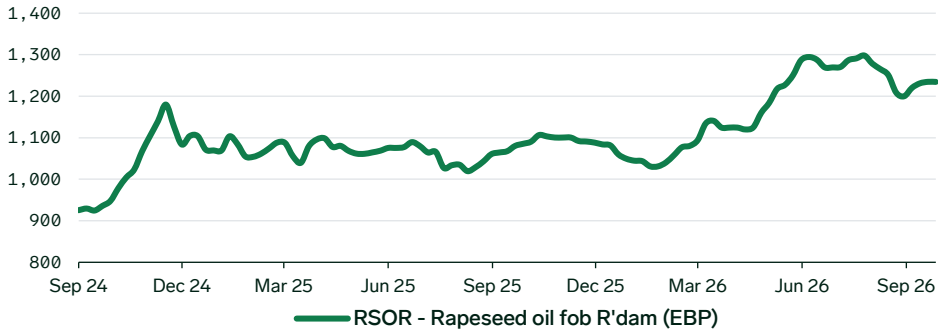

The average weekly price of EU Rapeseed as of September 30 increased by 1.4% MOM and rose by 14.8% YOY to €543/MT. Market players linked the monthly increase to a smaller-than-expected EU crop and severe Rhine logistics constraints, with JRC MARS cutting its yield forecast to 3.10 t/ha and Kaub water levels falling to historically low levels. Looking ahead, improving external supply from Ukraine and Australia could ease some pressure, although inland logistics remain a key watchpoint.

Rapeseed Canada - CAD/MT

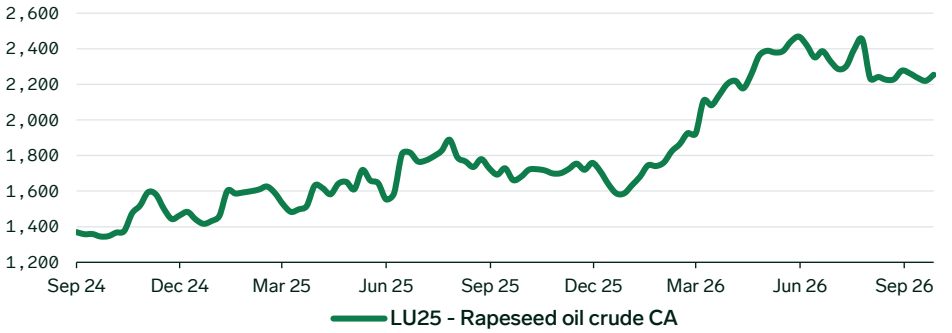

The average weekly price of Canadian Rapeseed as of September 30 increased by 3.4% MOM and rose by 33.2% YOY to CAD 822.72/MT. Sources said harvest delays, uneven crop conditions and stronger domestic crushing have limited the amount of Canada's large crop becoming readily available to export, supporting prices despite production estimates of 22.1-22.5 million mt. Harvest progress, crop quality and the pace of domestic crush will remain key watchpoints into October.

Rapeseed Oil EU - €/MT

The average weekly price of EU Rapeseed Oil as of September 30 increased by 2.1% MOM and rose by 14.3% YOY to €1,234.50/MT. Market players said the 2.1% month-on-month increase was supported by firm biodiesel demand and favourable RME margins, which continued to absorb rapeseed oil despite the harvest period. Low Rhine water levels also restricted inland movement, keeping prompt supply less accessible than headline production suggested. Sources said logistics and fuel-sector demand will remain key drivers into October.

Rapeseed Oil Canada - CAD/MT

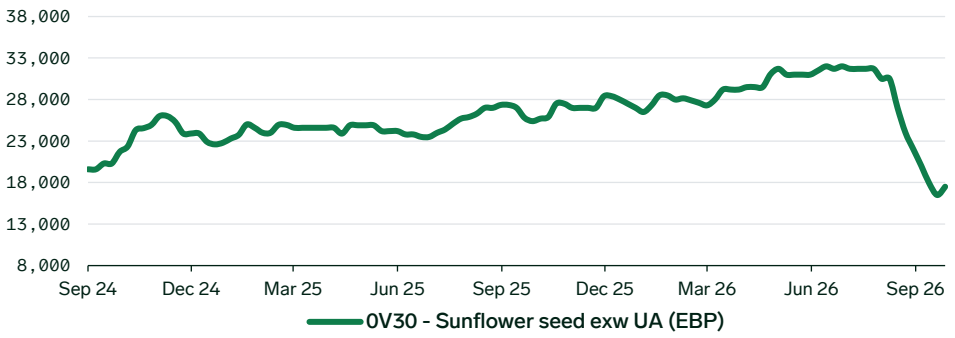

The average weekly price of Canadian Rapeseed Oil as of September 30 increased by 1.1% MOM and rose by 35.6% YOY to CAD 2,254.27/MT. Sources linked the 1.1% month-on-month increase to strong domestic processing demand and uncertainty around the availability of newly harvested canola. Canadian crush reached 8.92 million mt in January-August, while canola oil output rose to 3.81 million mt, limiting the extent to which the larger crop has loosened the market. Crop quality, harvest completion and processing demand remain key watchpoints.

Oilseeds and Vegetable Oils

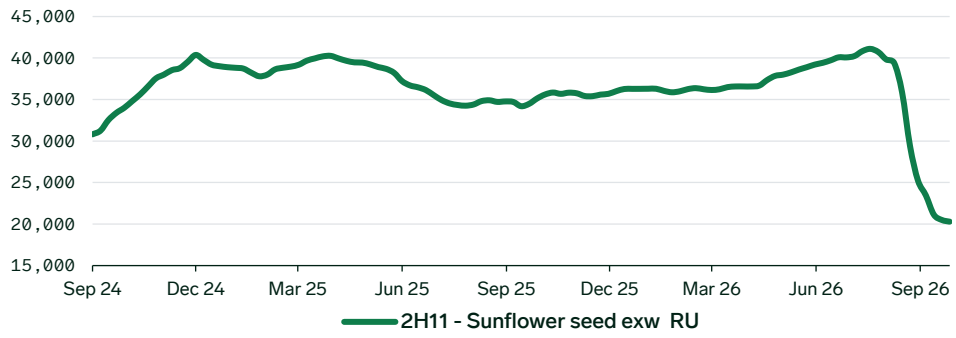

Sunflower Seed & Sunflower Oil

Sunflower Seed Ukraine - UAH/MT

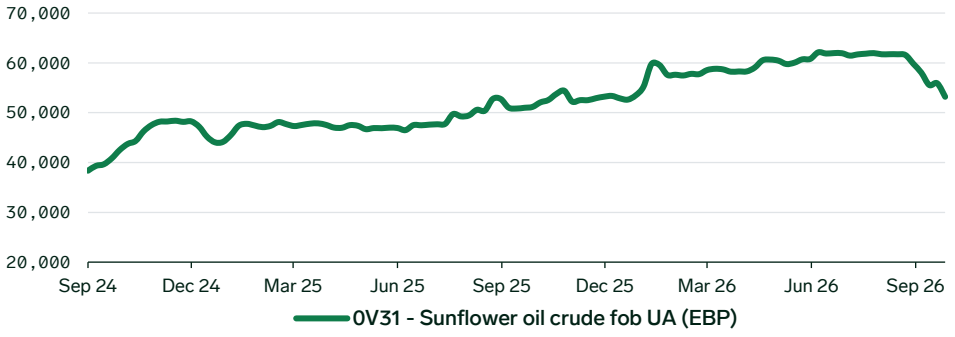

The average weekly price of Ukrainian Sunflower Seed as of September 30 decreased by 27.1% MOM and declined by 32.2% YOY to UAH 17,500/MT. Market players attributed the 27.1% month-on-month decline to heavier seasonal pressure as larger new-crop supply entered the market. Official and trade estimates point to a substantially larger Ukrainian crop this season, while crushers were reported to be reasonably well covered nearby and buyers remained cautious. Sources said Black Sea logistics remain constrained, limiting how quickly cheaper origin supply can clear the market.

Sunflower Seed Russia - RUB/MT

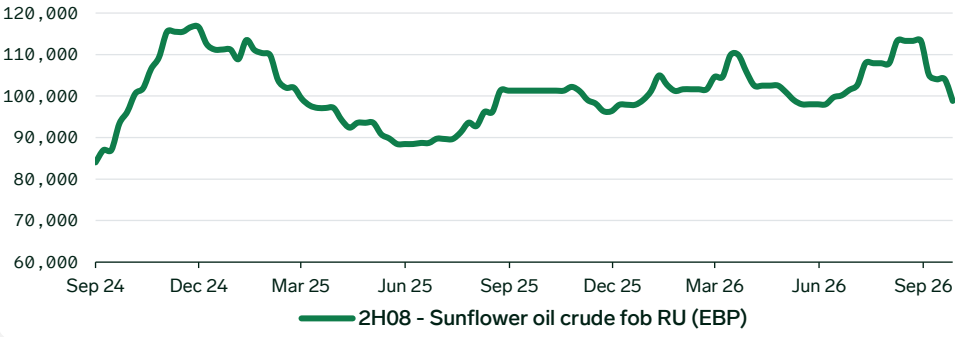

The average weekly price of Russian Sunflower Seed as of September 30 decreased by 31.0% MOM and declined by 41.2% YOY to RUB 20,290/MT. Sources linked the 31.0% month-on-month decline to rising new-crop availability, with USDA forecasting Russian sunflower production at 20.7 million mt, up from 17.5 million mt last season. Market players said weak nearby demand and restricted export execution have increased pressure on domestic values as harvest progresses. Export capacity and crushing utilisation remain key watchpoints.

Sunflower Oil Ukraine - UAH/MT

The average weekly price of Ukrainian Sunflower Oil as of September 30 decreased by 13.6% MOM and rose by 4.3% YOY to UAH 53,188.99/MT. Market players said the 13.6% month-on-month decline reflected increasing new-crop supply and weaker origin values, while destination demand remained selective rather than urgent. Persistent Black Sea and Danube logistics constraints have prevented cheaper Ukrainian supply from moving smoothly into destination markets, meaning pressure has been more pronounced at origin. India's duty cut could provide stronger demand support later in the season.

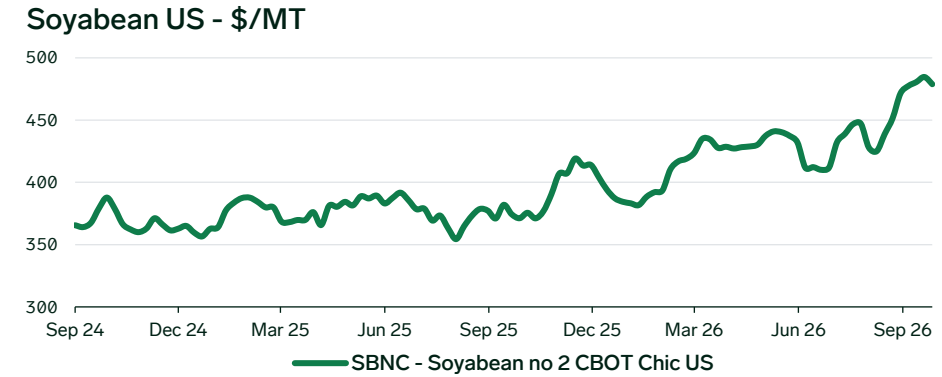

Sunflower Oil Russia - RUB/MT

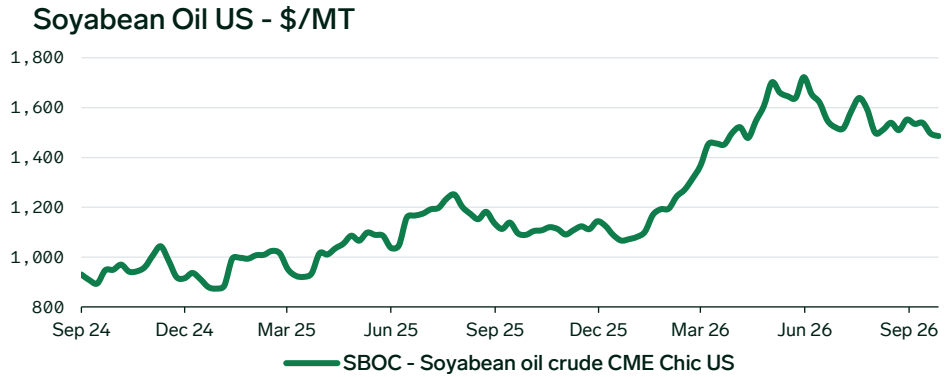

The average weekly price of Russian Sunflower Oil as of September 30 decreased by 12.8% MOM and declined by 2.4% YOY to RUB 98,825/MT. Sources attributed the 12.8% month-on-month decline to rising seasonal supply, weak nearby demand and continued difficulty exporting oil through traditional Black Sea routes. Deep-water ports remain heavily constrained, forcing longer and lower-capacity alternative routes and increasing the risk of supply accumulating domestically. Market players said export execution will remain the key factor determining whether pressure persists.

Oilseeds and Vegetable Oils

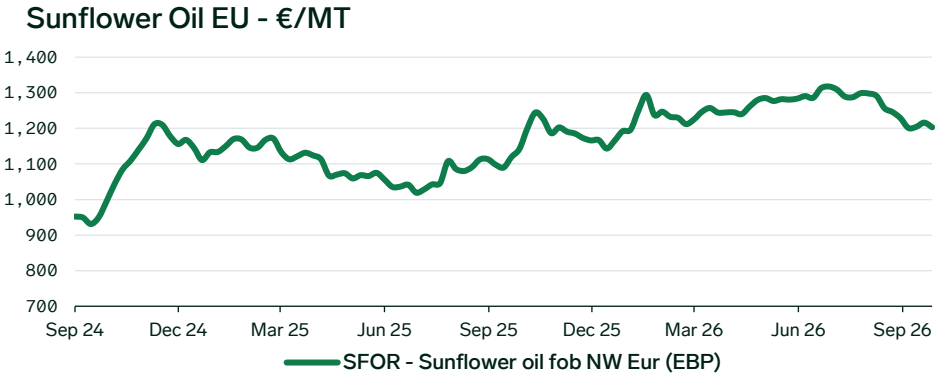

Sunflower Oil; Soyabean & Soyabean Oil

The average weekly price of US Soyabean as of September 30 increased by 6.0% MOM and rose by 27.9% YOY to $478.80/MT. Market players linked the 6.0% month-on-month increase to strong Chinese buying, firm crush demand and wet US harvest conditions, which created localized shortages and supported nearby values. China purchased more than 12 million mt of US soybeans during 2026, while persistent rainfall slowed new-crop arrivals into crushing plants. Looking ahead, Chinese purchasing, harvest progress and expectations for larger South American supply remain the key watchpoints.

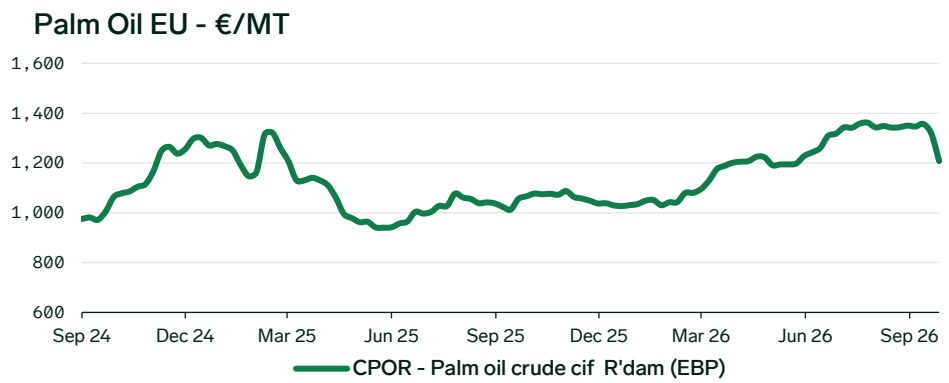

The average weekly price of US Soyabean Oil as of September 30 decreased by 1.6% MOM and rose by 35.7% YOY to $1,485.90/MT. Sources said the 1.6% month-on-month decline reflected periods of weakness in crude oil and broader uncertainty across the soybean complex, although strong underlying fundamentals limited the downside. NOPA data showed US soybean oil stocks at 0.8 million mt, the lowest since January 2025, while March-August consumption reached a record 7.32 million mt, up 20% year-on-year, largely due to biofuel demand. Crude oil movements, US crush demand and harvest progress remain key watchpoints.

The average weekly price of EU Sunflower Oil as of September 30 decreased by 3.4% MOM and rose by 7.4% YOY to €1,202.87/MT. Market players linked the 3.4% month-on-month decline to rising Black Sea supply and cautious destination demand, with larger Russian and Ukrainian crops increasing origin-side availability. Sources said export constraints prevented this supply from clearing smoothly, limiting the downside in destination markets. Looking ahead, India's import duty cut could improve demand, although Black Sea logistics remain the key watchpoint.

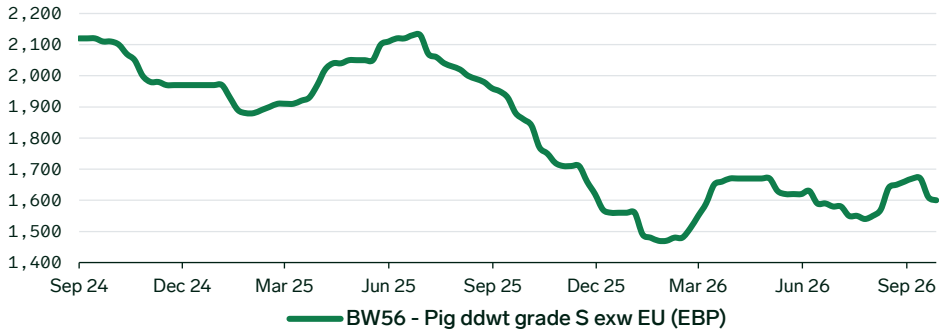

Oilseeds and Vegetable Oils

Palm Oil

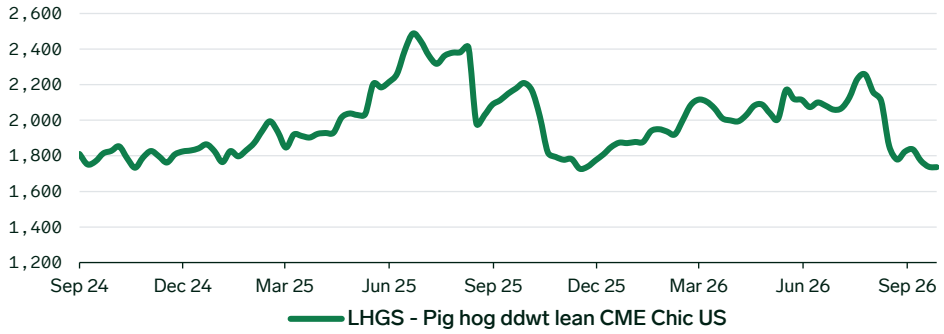

The average weekly price of EU Palm Oil as of September 30 decreased by 10.1% MOM and rose by 14.3% YOY to €1,207.28/MT. Market players linked the 10.1% month-on-month decline to a softer Malaysian supply-demand balance, with September exports falling sharply while production remained firm. Cargo surveyors estimated full-month shipments down 17.1-28.8% from August, increasing expectations of a larger stock build and reducing nearby buying urgency. Looking ahead, improved Indian import economics and El Niño-related production risks could provide some support to deferred values, although the prompt market remains soft.

Pork EU - €/MT

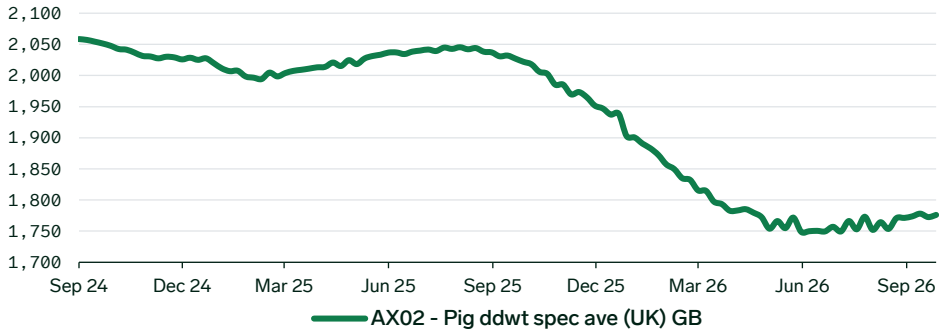

The average weekly price of EU Pork as of September 30 decreased by 3.0% MOM and declined by 14.9% YOY to €1,600/MT. Market sentiment turned weak during September as recovering supply met softening demand. Prices held broadly steady in the first half of the month and then fell in the second half. Live pig availability and slaughter weights recovered from August's heat stress, and slaughter numbers rose later in the month. High cold storage levels kept product availability ample across both the carcass and cuts complex.

Pork US - $/MT

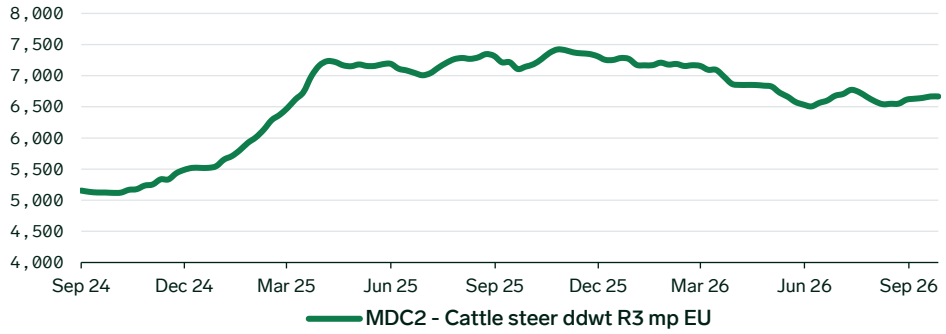

The average weekly price of US Pork as of September 30 decreased by 2.4% MOM and declined by 20.3% YOY to $1,736.17/MT. Pork prices in the US continued to soften during September, though the monthly decline was smaller than in August. Fully adequate supplies and subdued demand across both domestic and international markets continued to weigh on values.

Pork UK - £/MT

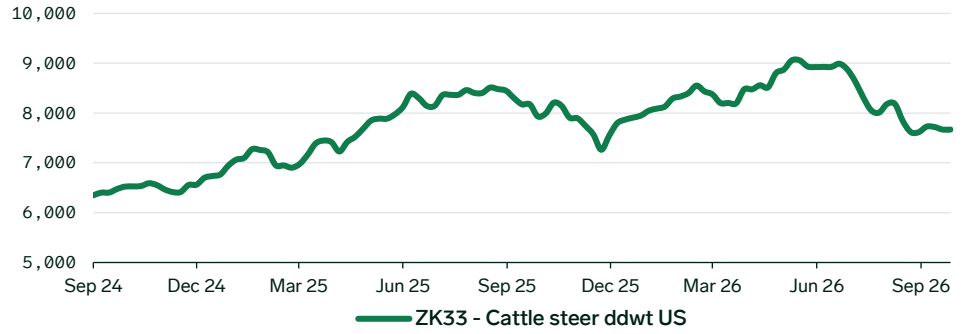

The average weekly price of UK Pork as of September 30 increased by 0.3% MOM and declined by 12.4% YOY to £1,776.10/MT.

Beef EU - €/MT

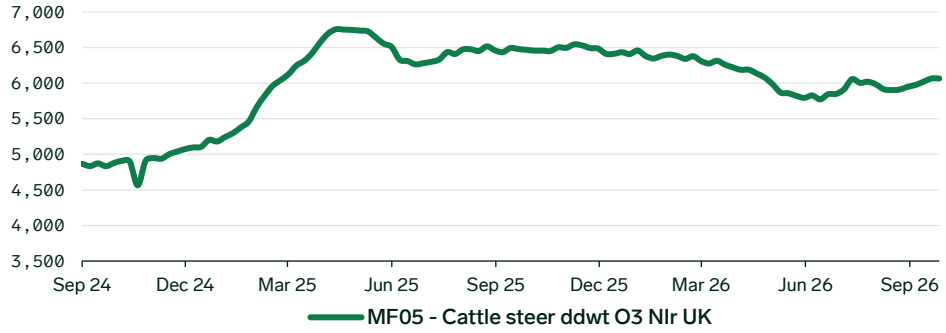

The average weekly price of EU Beef as of September 23 increased by 1.8% MOM and declined by 7.6% YOY to €6,666.20/MT, driven by a decline in cattle and beef supply. Some market participants believe the rise was also driven by lower import availability from Brazil, following the ban imposed on September 3. On a YOY basis, however, prices recorded a sharp decline of 7.6%, indicating continued downward pressure on the European beef market. EU cattle supply is tightening as farmers retain more animals amid relatively firm beef prices and reduced availability. According to the industry reports from the EU, cattle slaughter declined by 3.85% YOY during the first half of 2026.

Beef US - $/MT

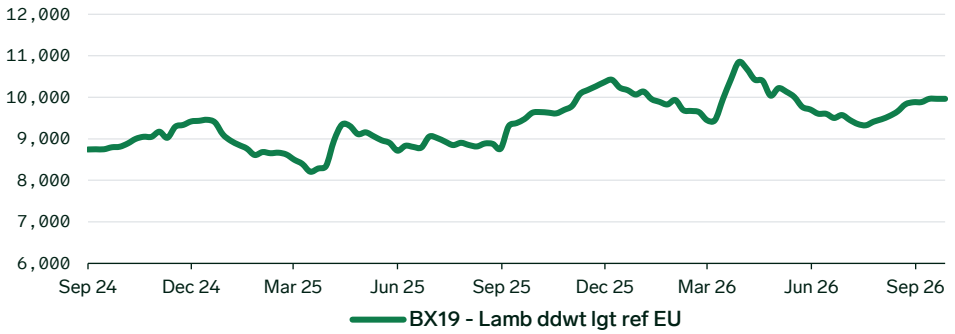

The average weekly price of US Beef as of September 30 increased by 0.7% MOM and declined by 6.2% YOY to $7,668.48/MT. Live cattle prices were about steady. Cooler-weather buying interest for end cuts was mostly muted, with buyers remaining largely on the sidelines. Middle meats have held mostly steady as rib availability remained limited, causing firm prices to hold, which in turn contributed to some buyers looking at loin items as an economical alternative. Overall demand was mostly hand-to-mouth throughout the month, with an exception towards the end of the month when some buyers scrambled to secure product after labor issues tightened the supply picture.

Beef UK - £/MT

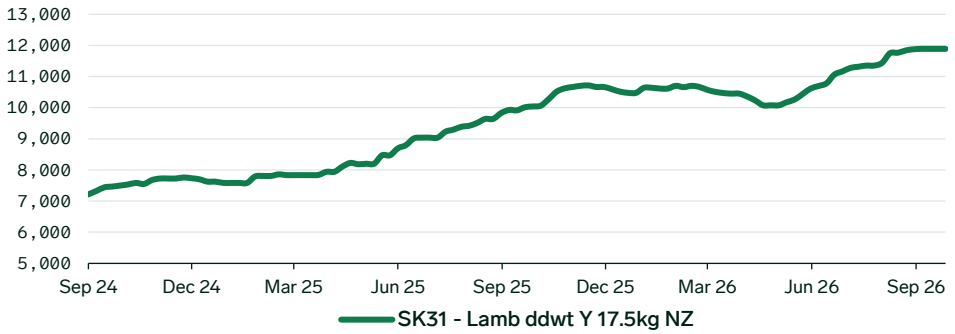

The average weekly price of UK Beef as of September 23 increased by 2.8% MOM and declined by 6.6% YOY to £6,065/MT. Industry participants also reported mixed sentiment: some sources noted steady to weak demand, while others pointed to rising sales in certain categories. Some market participants reported a sharp price drop for featherblades, as demand has plummeted. Prices for trims, chuck, and blade fell amid slow trading activity, while prices for fillets, briskets, and rib-eyes continued to rise, driven by low availability of these cuts. Prices of some round cuts increased, following the usual seasonal pattern. Market participants believe declining import volumes and Christmas procurement demand could further support prices for some UK beef cuts.

Lamb EU - €/MT

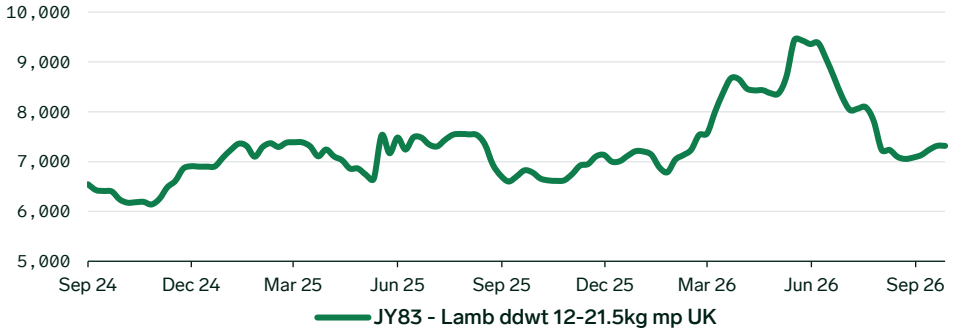

The average weekly price of EU Lamb as of September 16 increased by 4.3% MOM and rose by 7.1% YOY to €9,963.80/MT. Prices strengthened as seasonal supplies tightened and slaughter remained below year-ago levels. Moderate imports helped maintain adequate market availability.

Lamb New Zealand - NZD/MT

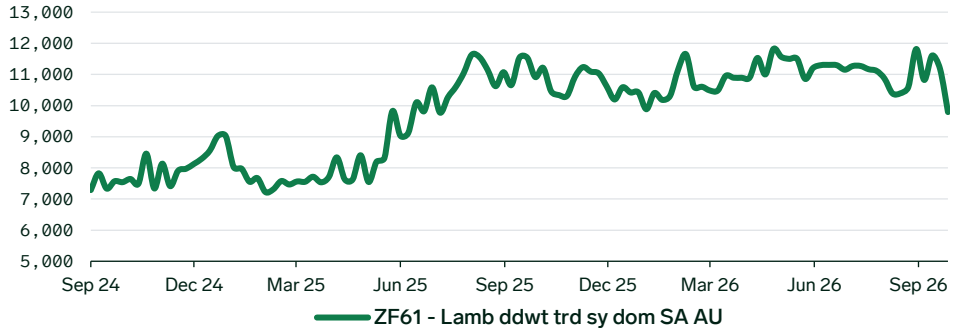

The average weekly price of New Zealand Lamb as of September 30 increased by 0.4% MOM and rose by 18.7% YOY to NZD 11,890.29/MT. Prices strengthened as tight seasonal supplies and lower slaughter availability supported the market. Overall supplies remained below year-ago levels.

Lamb UK - £/MT

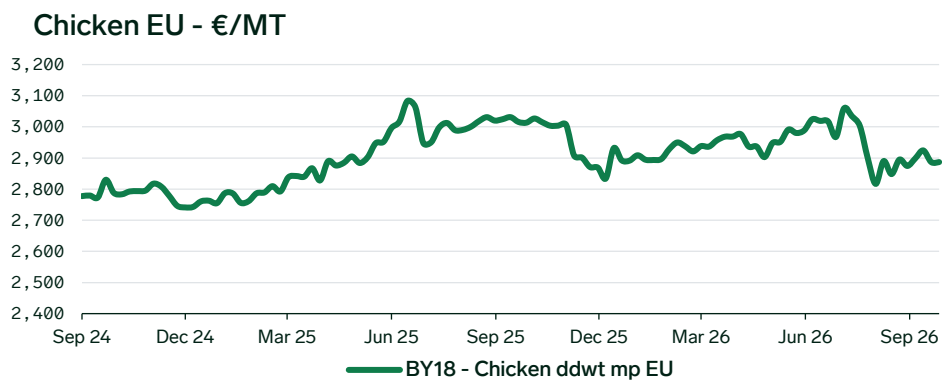

The average weekly price of UK Lamb as of September 30 increased by 3.7% MOM and rose by 7.2% YOY to £7,316/MT. Market-ready supplies remained adequate and below earlier seasonal highs.

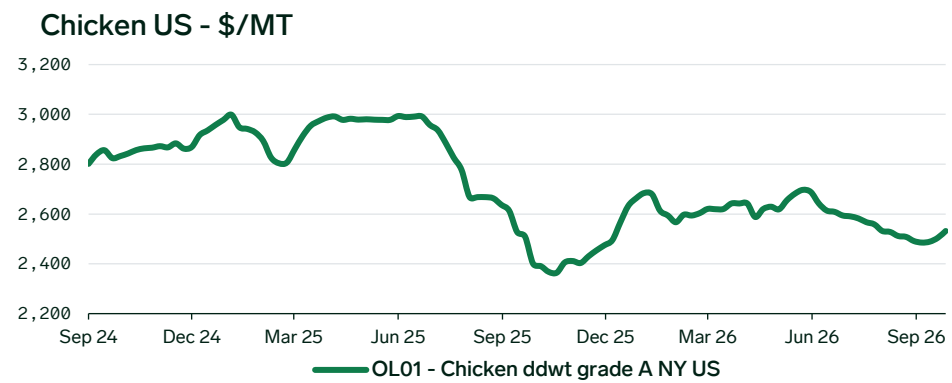

Lamb Australia - AUD/MT

The average weekly price of Australian Lamb as of September 30 decreased by 7.6% MOM and declined by 15.1% YOY to AUD 9,791.32/MT. Increased seasonal availability and active processing pressured prices, while producer interest in adding weight helped maintain adequate supplies.

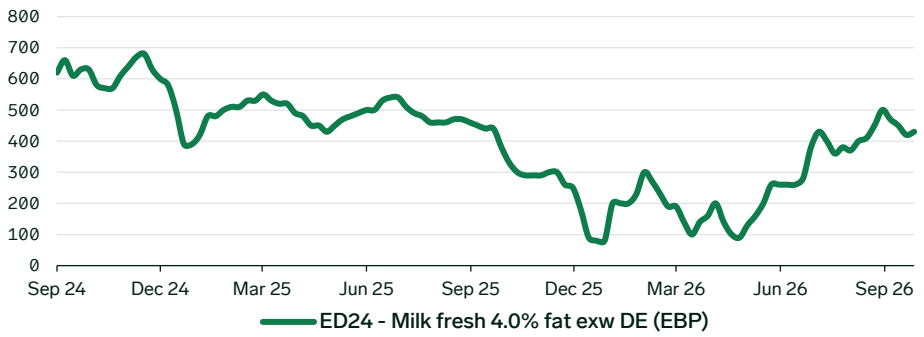

The average weekly price of EU Chicken as of September 23 increased by 1.4% MOM and declined by 4.8% YOY to €2,886.76/MT. The price rise was driven by an increase in demand from the market. According to market sources, a ban on Brazilian poultry from September 3, 2026, constrained the supplies on the market, which supported domestic chicken prices in September. According to market sources, the impact of the 2026 droughts and heatwaves across western and central Europe is expected to put pressure on feed grain prices and availability, increasing production costs.

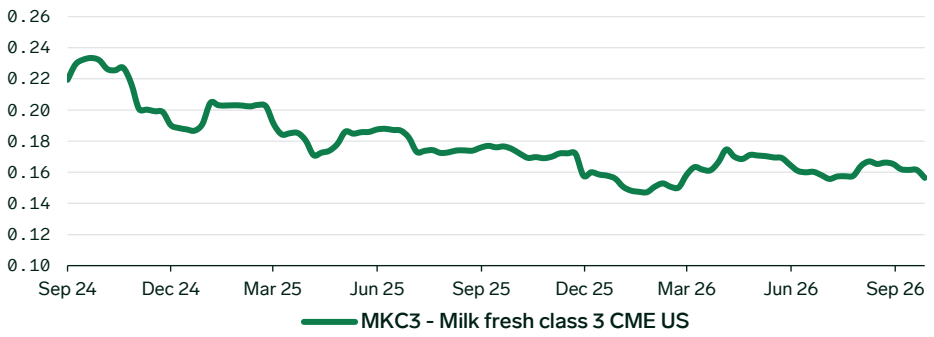

The average weekly price of US Chicken as of September 30 increased by 0.9% MOM and rose by 0.9% YOY to $2,531.76/MT. Most indications painted a balanced picture to this line thanks to adequate supplies and consistent retail and cutting demand. Current wholesale demand patterns remain generally consistent across much of the complex, though some marketers, particularly those with exposure to chicken wings, remain somewhat underwhelmed by the seasonal draw so far. Elsewhere, players with foodservice and retail exposure maintain a cautiously bullish sentiment given chicken's relatively attractive value in comparison to other proteins.

Milk EU - €/MT

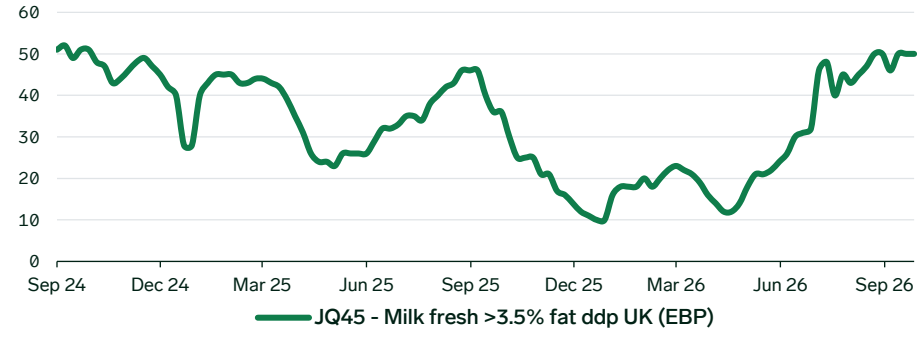

The average weekly price of EU Milk as of September 30 decreased by 4.4% MOM and declined by 2.3% YOY to €430/MT. [Analyst commentary The downward price movement was driven by a combination of milk surplus due to delay in calving in some European markets. Consumers demand was noted as steady, while industrial buying interest remained strong.

Milk US - $/Lb

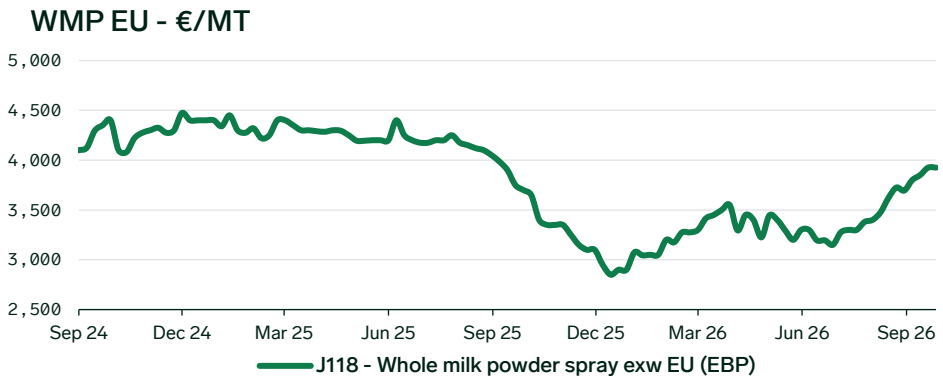

The average weekly price of US Milk as of September 30 decreased by 5.9% MOM and declined by 11.4% YOY to $0.16/Lb. Class III milk prices maintained their downward trajectory throughout September, Class III milk prices maintained their downward trajectory throughout September, extending a decline that reflects mounting pressure from multiple directions within the US dairy complex. Elevated milk flows and softening cheese prices combined to create a bearish environment that limited any opportunity for price increases.

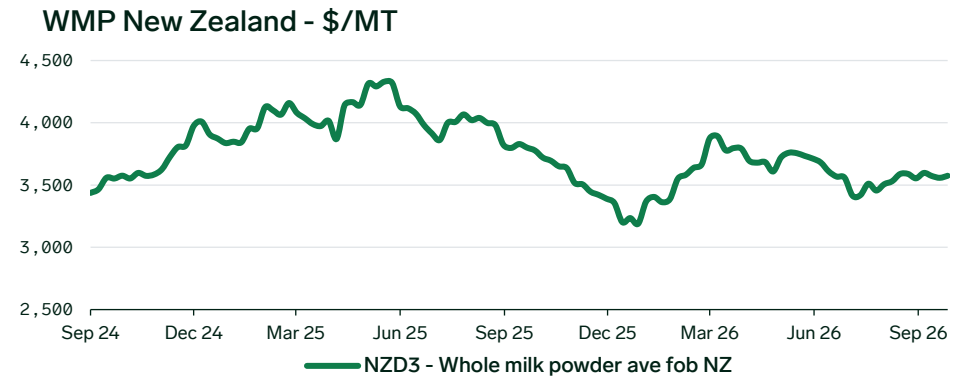

Milk UK - GBp/L

The average weekly price of UK Milk as of September 30 was unchanged MOM and rose by 38.9% YOY to GBp 50/L. Seasonal milk intake continued, tightening spot availability throughout the month across the UK. On the demand side, consumer demand held steady, while industrial buying turned stable.

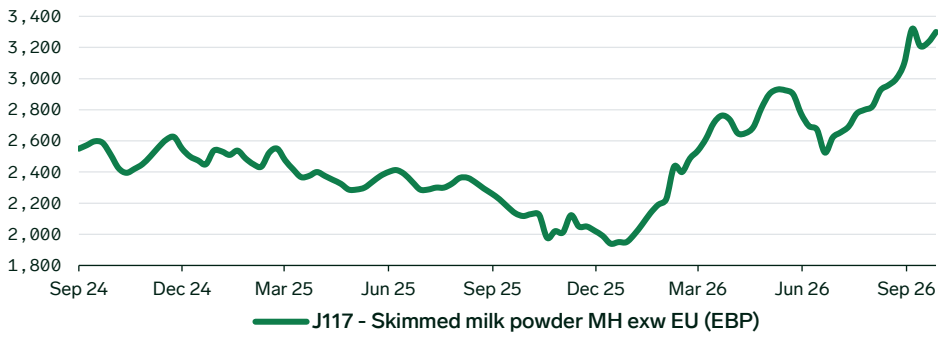

The average weekly price of EU WMP as of September 30 increased by 5.4% MOM and rose by 4.7% YOY to €3,925/MT. Strong domestic and international demand, combined with tight milk supply and the overall firm sentiment across the dairy complex, continued to support the upward price movement during the month. Supply across the EU was reported as steady, with fresh production largely centered on contracted volumes, according to market players, and only limited additional volumes produced.

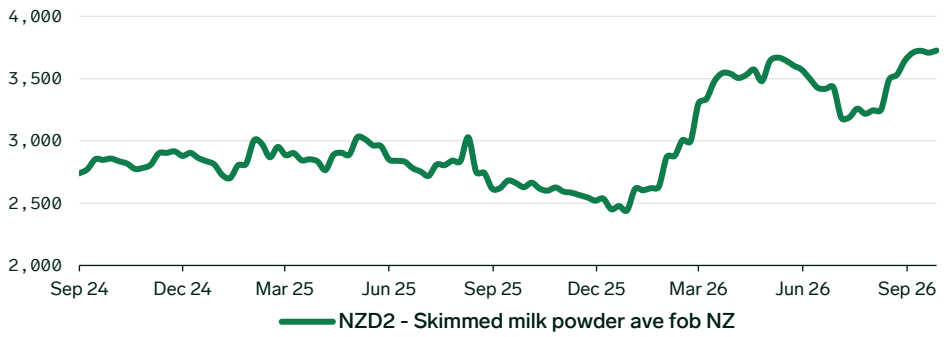

The average weekly price of New Zealand WMP as of September 30 decreased by 0.4% MOM and declined by 5.9% YOY to $3,574.71/MT. WMP prices across New Zealand edged during down. Market players noted strong buying interest across key trading partners in the APAC region. Additionally, supply remains tight, while with the New Zealand milk season approaching, WMP production remained steady, according to industry players.

SMP EU - €/MT

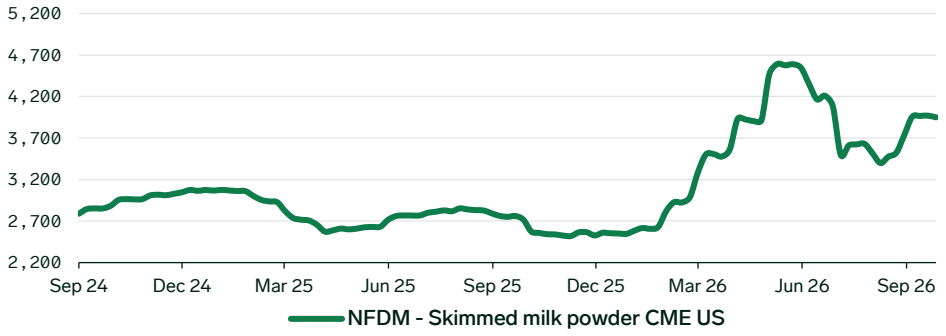

The average weekly price of EU SMP as of September 30 increased by 10.0% MOM and rose by 54.6% YOY to €3,300/MT. The upward momentum was supported by the continued tight milk supply situation across the EU, linked to the ongoing heatwave impacting milk intakes throughout the month. SMC prices increased strongly during August, trading at times above SMP price levels, adding significant upward pressure to the powder complex. Additionally, limited US supply drove increased international buying interest toward EU product, further supporting the firm market tone, according to market sources.

SMP New Zealand - $/MT

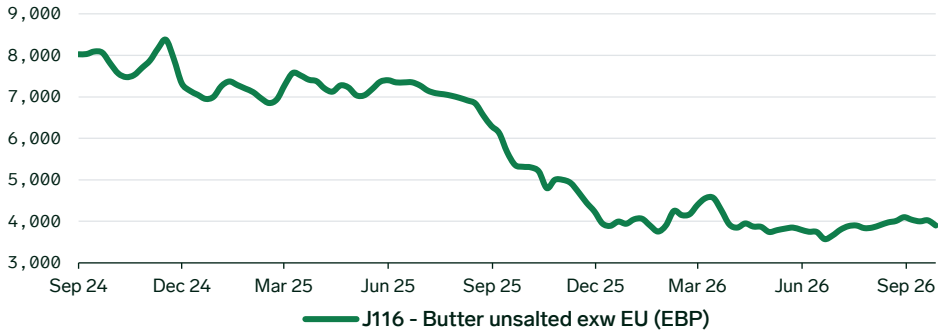

The average weekly price of New Zealand SMP as of September 30 increased by 5.5% MOM and rose by 40.0% YOY to $3,725.82/MT. In line with the EU market, SMP prices across New Zealand increased compared to the previous month. This can largely be linked to increased international buying interest, as tight US supply of NFDM has led EU and New Zealand exporters to step in to supply markets across the APAC region. Supply was reported as in line with seasonal expectations, according to market sources.

NFDM - SMP US - $/MT

The average weekly price of US NFDM - SMP as of September 30 increased by 12.1% MOM and rose by 43.1% YOY to $3,949.25/MT. Nonfat dry milk (NFDM) prices pushed higher during the month, driven by a combination of strong domestic demand and tight to sold-out inventory levels that created genuine supply constraints across the US market.

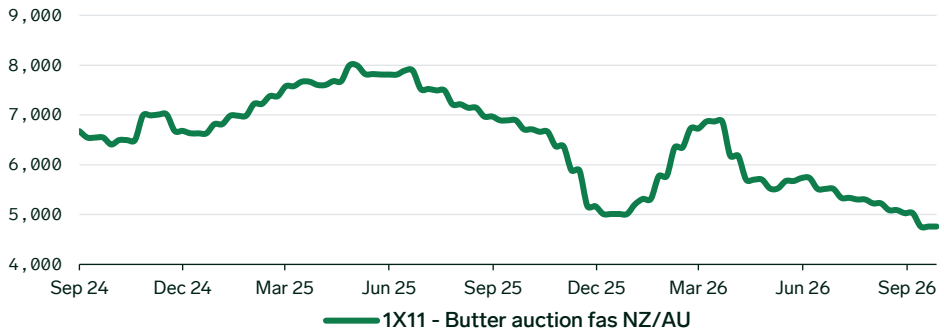

Butter EU - €/MT

The average weekly price of EU Butter as of September 30 decreased by 2.7% MOM and declined by 27.2% YOY to €3,900/MT. EU butter market sentiment turned weak in September, with prices declining, as ample availability and large stocks continued to weigh on the market. Market sources reported that both fresh and frozen butter were readily available, while end users were largely covered for their immediate requirements. Demand remained steady but muted, with limited spot buying interest and only some open requirements reported for Q4. The weaker market was primarily attributed to high butter stocks and an overall surplus of milk fat.

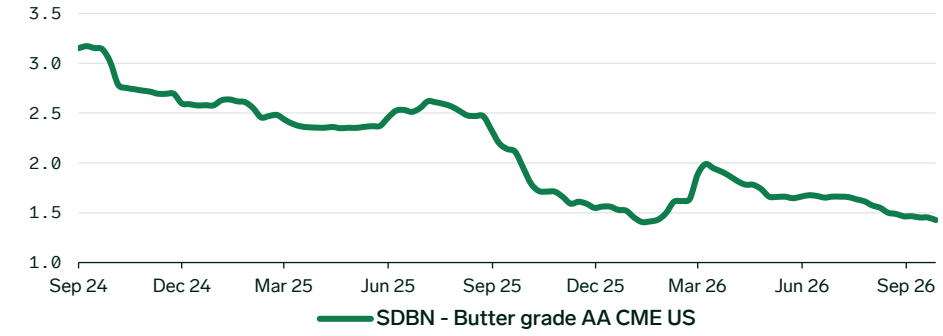

.

Butter New Zealand - $/MT

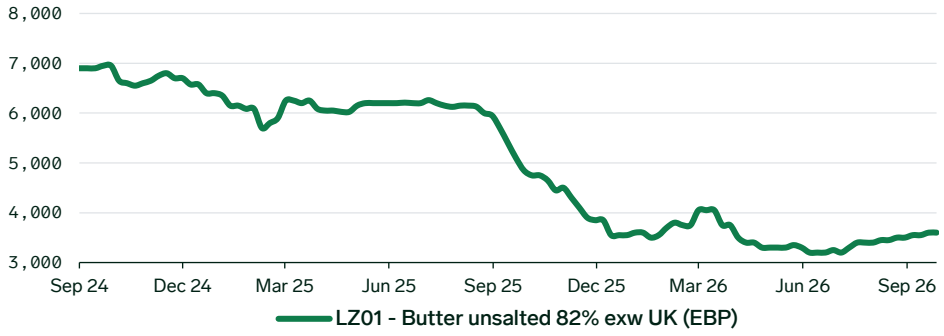

The average weekly price of New Zealand Butter as of September 30 decreased by 6.5% MOM and declined by 30.9% YOY to $4,760/MT. Weak demand across the APAC region was the key driver behind the soft market tone across the NZ butter market. Production was reported by multiple market sources to be in line with seasonal expectations.

Butter US - $/Lb

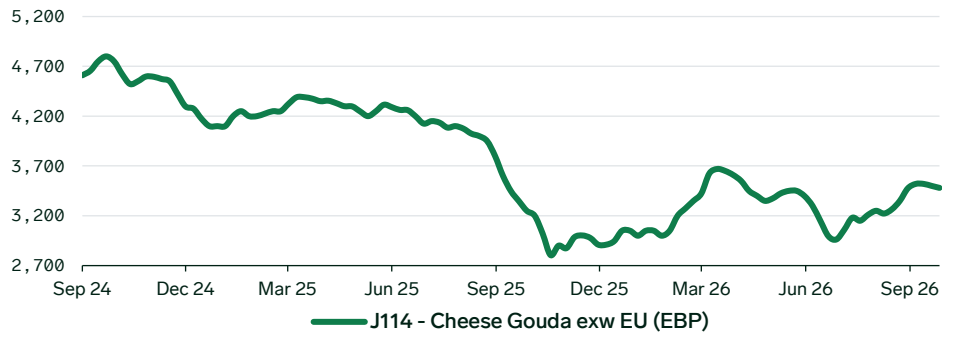

The average weekly price of US Butter as of September 30 decreased by 4.2% MOM and declined by 32.5% YOY to $1.43/Lb. Butter prices continued their downward trajectory in September, mirroring weakness from the prior month and reflecting a market struggling under the weight of ample cream supplies and tepid domestic demand. The combination of strong milk components supporting elevated cream availability and soft buying interest from foodservice and retail channels created a persistently bearish environment.

Butter UK - £/MT

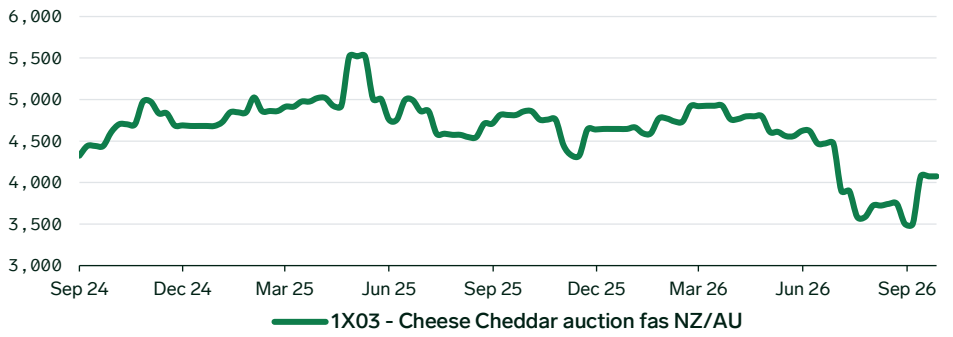

The average weekly price of UK Butter as of September 30 increased by 2.9% MOM and declined by 29.4% YOY to £3,600/MT. Firm sentiment across the dairy fats complex continued into the UK fresh butter market during September, pushing price levels higher throughout the month. Multiple market players noted a notable reduction in production output, stemming from a sharp tightening in liquid dairy fat availability driven by declining milk intakes and constrained cream supply. The supply-side squeeze was widely cited as the primary factor underpinning the firm market tone during the period.

Gouda EU - €/MT

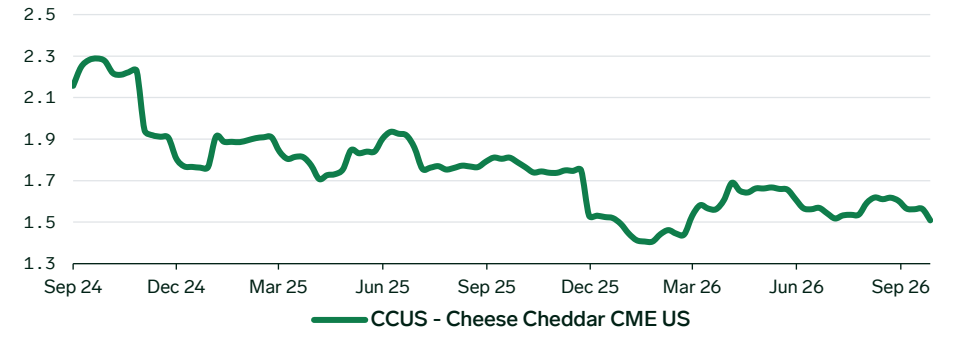

The average weekly price of EU Gouda as of September 30 decreased by 3.9% MOM and rose by 4.0% YOY to €3,480/MT. Gouda prices decreased for two consecutive months in September after several months of rises. Prices eased as majority of buyers are already partially covered, there was little urgency to secure additional volumes in the short term. At the same time, some producers again reported healthy availability, which continued to weigh on the market tone. Overall, the market remains balanced, although sentiment continues to lean slightly softer

Cheddar New Zealand - $/MT

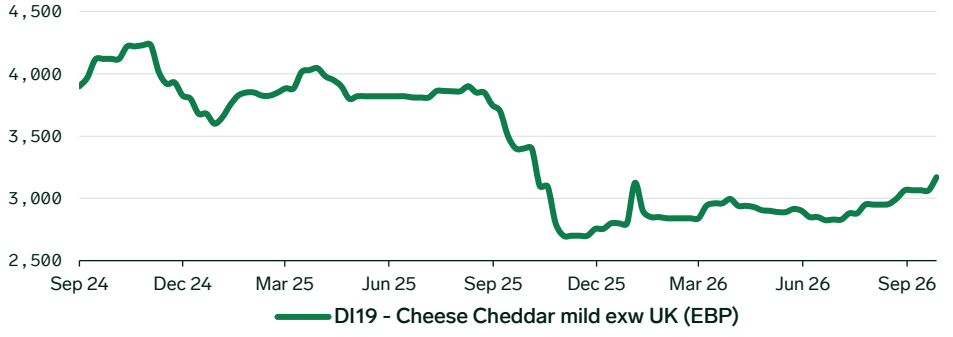

The average weekly price of New Zealand Cheddar as of September 30 increased by 8.8% MOM and declined by 15.4% YOY to $4,075/MT. An overall firm market sentiment across the dairy complex, in combination with growing demand across key trading partners throughout the APAC region, supported an uptick in price levels across the New Zealand cheese complex during August.

Cheddar US - $/Lb

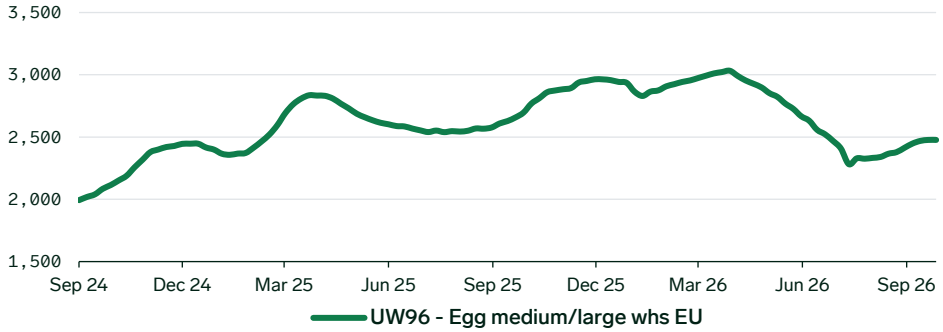

The average weekly price of US Cheddar as of September 30 decreased by 6.7% MOM and declined by 16.7% YOY to $1.51/Lb. Cheese prices moved lower during the month, reflecting a market struggling under the weight of growing production across the country and limited domestic demand that has forced the industry to rely increasingly on export markets to absorb available supplies and keep stock levels balanced.

Cheddar UK - £/MT

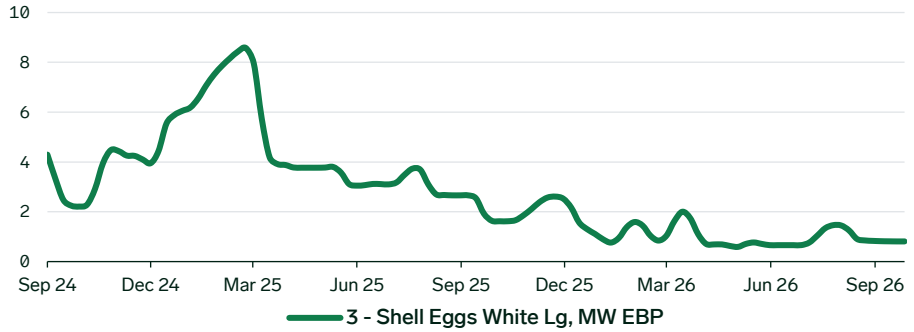

The average weekly price of UK Cheddar as of September 30 increased by 5.7% MOM and declined by 6.8% YOY to £3,170/MT. Increasing buying interest across both the consumer and industrial segments supported an upward price movement after summer. The supply side was reported as steady month on month; however, market sources noted that volatile milk intakes continue to challenge production planning.

Egg EU - €/MT

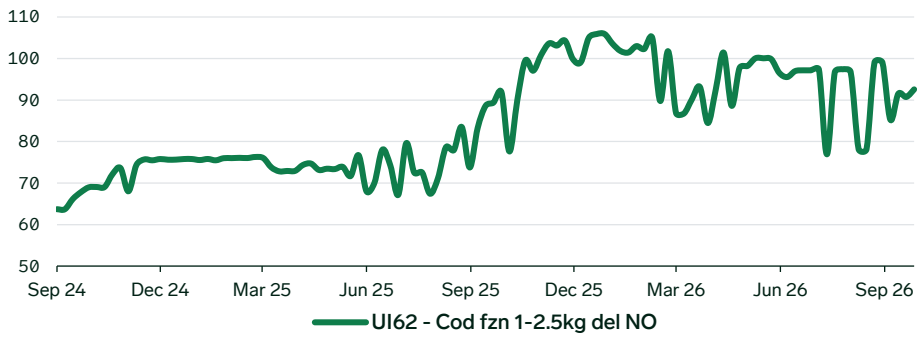

The average weekly price of EU Egg as of September 23 increased by 4.7% MOM and declined by 5.8% YOY to €2,477.03/MT. Retail demand provided underlying support during September, reflecting the typical return to more regular household consumption patterns after the summer holidays, with the back-to-school period also contributing to the seasonal pickup in demand. Availability tightened in selected markets, particularly for larger egg sizes. Shortages of L and XL eggs persisted, while M-size eggs remained readily available.

Egg US - $/dzn

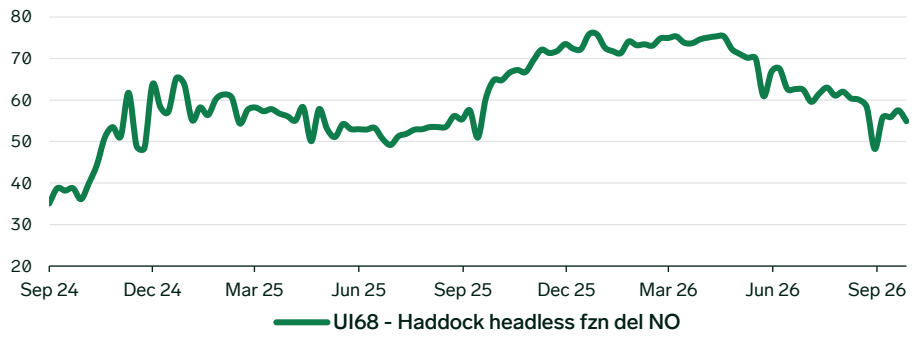

The average weekly price of US Egg as of September 30 decreased by 4.7% MOM and declined by 57.9% YOY to $0.81/dzn. The US egg market remained generally steady through most of the month, with seasonally low wholesale values reflecting the continued imbalance between fair but unremarkable demand and growing domestic supply. Export movement remained a critical outlet for surplus production and helped prevent a more burdensome buildup in domestic inventories, but it has not been enough to generate a broader recovery in shell egg values.

Cod Norway - NOK/kg

The average weekly price of Norway Cod as of September 30 decreased by 6.6% MOM and rose by 3.6% YOY to NOK 92.56/kg. The Norwegian cod market is seeing a slowdown in upward price pressure. Last month, the average price was 18.9% higher YOY, compared with 3.6% higher YOY in September. According to the Directorate of Fisheries, accumulated landings up to August reached 112,110 mt, accounting for a 16.8% YTD decrease. This reduction aligns with Norway's 2026 quota, which represents a 16% decrease compared to 2025.

Haddock Norway - NOK/kg

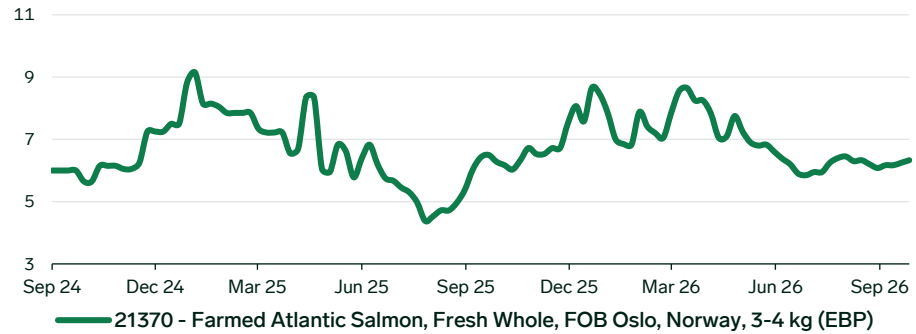

The average weekly price of Norway Haddock as of September 30 decreased by 5.9% MOM and declined by 9.0% YOY to NOK 54.88/kg. The H&G Norwegian haddock price declined MOM, influenced by improved availability YOY. As last year, market sentiment remained firm this year supported by the Atlantic cod shortage. Haddock landings continue to display recovery, with accumulated landings up to August reaching 57,413 mt, a 6.4% YTD increase, according to the Norwegian Directorate of Fisheries.

Alaska Pollock Russia - $/MT

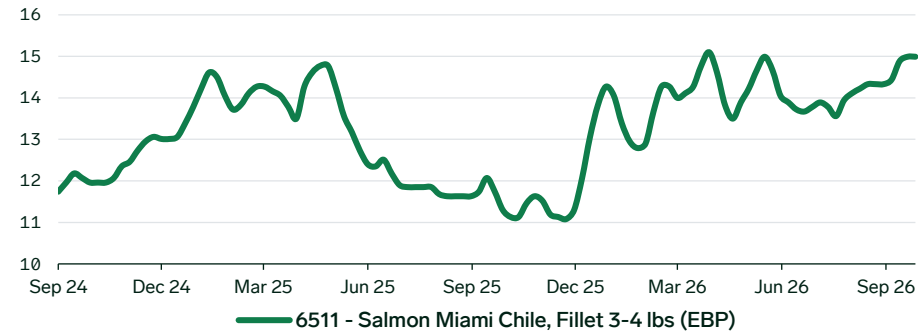

The average weekly price of Russian Alaska Pollock as of September 30 decreased by 2.7% MOM and rose by 56.7% YOY to $5,115.70/MT. The price decline MOM is more a currency effect than a change in market sentiment, as current fishing conditions continue to be challenging in Russia. This, coupled with limited inventory levels in Europe, is sustaining a firm market tone.

Expana

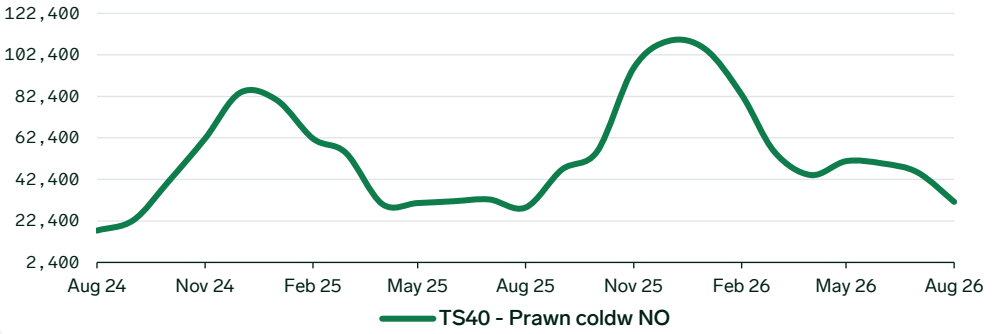

The average weekly price of Norway Salmon as of September 30 increased by 2.1% MOM and declined by 2.6% YOY to €6.33/kg. The Norwegian Atlantic salmon market sentiment was influenced by a shortage of larger sizes due to the generation transition, coupled with active demand in China ahead of the Golden Week, which added upward pressure on prices. According to the Norwegian Directorate of Fisheries, the live biomass of Norwegian salmon increased slightly compared with July, up 0.6% MOM and 0.3% YOY. In addition, total harvest volumes through August were 3.7% higher YTD.

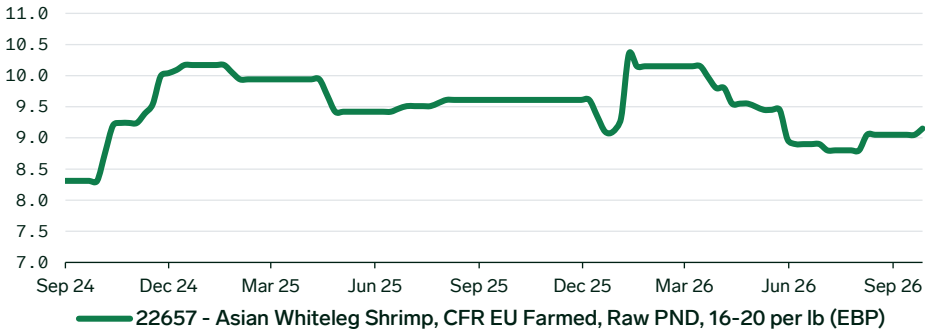

The average weekly price of Chilean Salmon as of September 30 increased by 4.6% MOM and rose by 27.7% YOY to $14.99/kg. The Chilean salmon market was firm in September. In the US market, supply was adequate to barely adequate, likely influenced by the Chilean national holiday. Demand was moderate to active, driving prices higher MOM in September. According to Subpesca, Chilean Atlantic salmon harvest increased by 20.1% MOM in July. In addition, accumulated harvest volumes from January to July were 7.1% higher YTD.

Prawn Norway* - NOK/MT

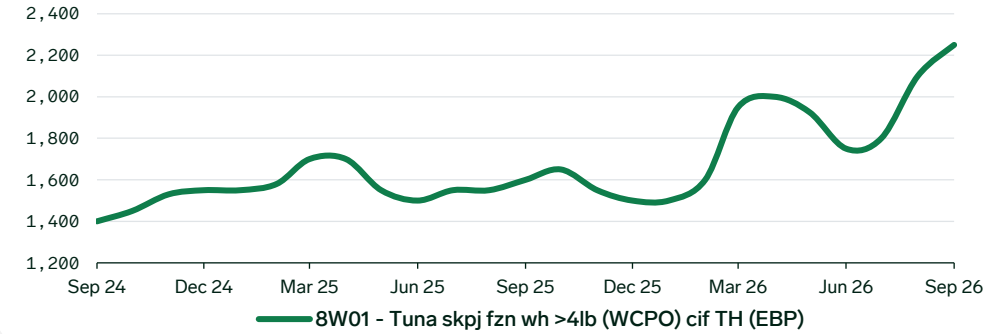

In August, the average price of Norwegian Prawn decreased by 31.0% MOM and rose by 9.5% YOY to NOK 31,573.65/MT. Norwegian cold-water shrimp demand softened further in August, as European buying interest thinned out with much of the market away on summer holidays, while Chinese buyers had already covered their needs ahead of the Mid-Autumn Festival and the wedding season. With both major demand centers largely absent from the market, fresh landed prices in Norway extended their decline from July, continuing the seasonal softening typically observed at this time of year.

Asian Whiteleg Shrimp - $/kg

The average weekly price of Shrimp Asian Whiteleg as of September 30 increased by 1.1% MOM and declined by 4.8% YOY to $9.15/kg. The peeled-and-deveined vannamei market ex-Asia held a broadly steady tone through September. European importers, particularly in the EU-UK, have locked in year-end orders from India, while the US and Chinese buying interest slowed down. On the supply side, sellers pushed for firmer offers as India's harvest season nears its close and rising feed, energy and freight costs compress margins, but buyers show resistance.

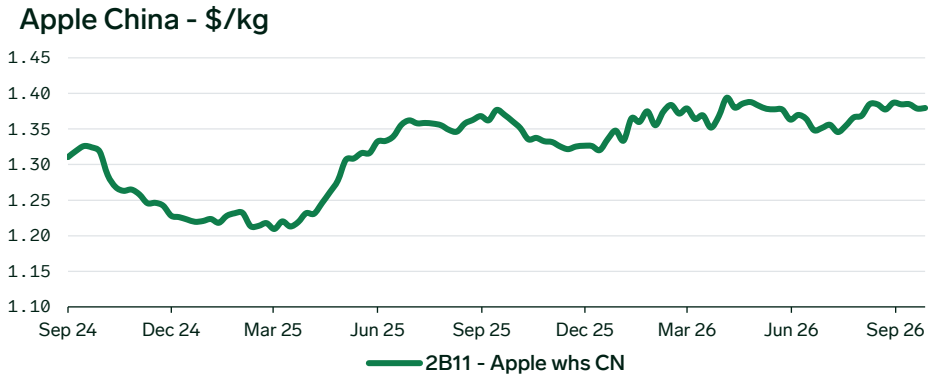

Tuna Thailand - $/MT

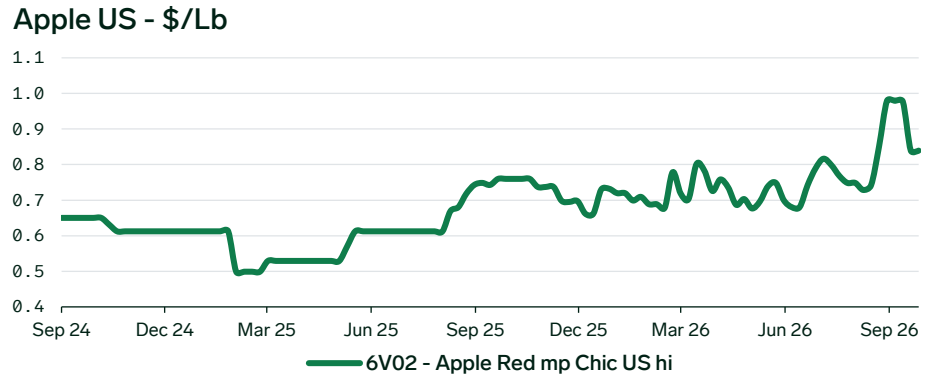

In September, the average price of Thai Tuna increased by 7.1% MOM and rose by 40.6% YOY to $2,250/MT. Thai skipjack tuna continues to show upward pressure in price as landings in the Western Central Pacific Ocean have been reported as challenging. This is combined by increases in production costs associated with fuel and shipping freight, which are driving the current market sentiment. Similar price trends have been observed for Ecuadorian skipjack tuna.

* April 2026 is the last available data.

Apples

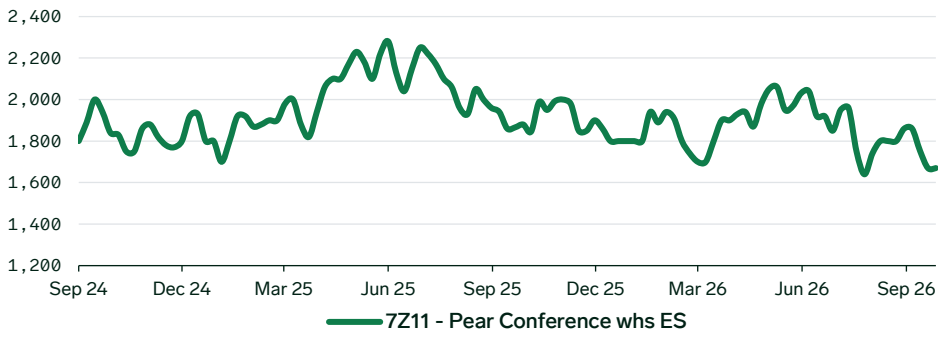

The average weekly price of Chinese Apple as of September 23 decreased by 0.4% MOM and rose by 0.1% YOY to $1.38/kg. This month, China's apple market is moving from earlier firmness into a softer, more competitive phase. Imported apples had been supported by limited supply and steady quality, particularly from New Zealand, but domestic new-crop arrivals are now increasing and putting pressure on prices and sales. Holiday demand offered only selective support, favoring premium gift packs and better-quality fruit rather than lifting the broader market. After the festival, traffic and turnover slowed, and apple gift-box prices fell sharply. Overall, abundant supply, cautious buying, and weaker post-holiday demand are creating a softer market tone.

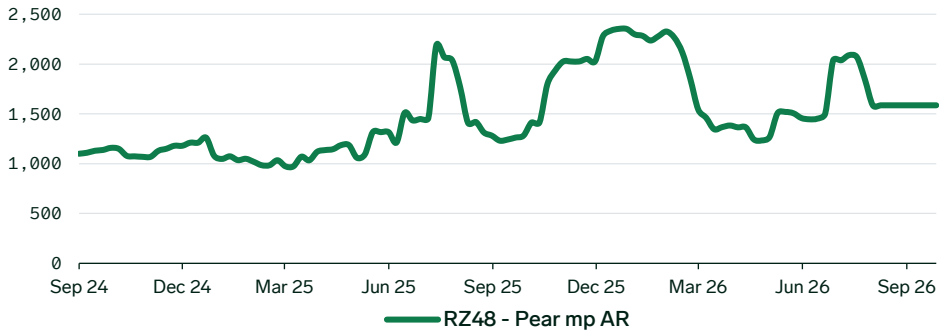

The average weekly price of US Apple as of September 23 increased by 13.1% MOM and rose by 13.0% YOY to $0.84/Lb. The US apple market is entering the new season this month with a smaller crop overall, but supply is highly uneven by region. Freeze losses in parts of Pennsylvania and Virginia are tightening availability, while Washington, Maine, and parts of the Pacific Northwest are reporting solid quality and more balanced volumes. Pricing is expected to stay relatively firm, according to sources, supported by reduced national production, steady consumer demand, and strong interest in both fresh and processing channels. At the same time, growers continue to face margin pressure from high operating costs, including labor and fuel, even where crop quality is strong.

Pear Spain - €/MT

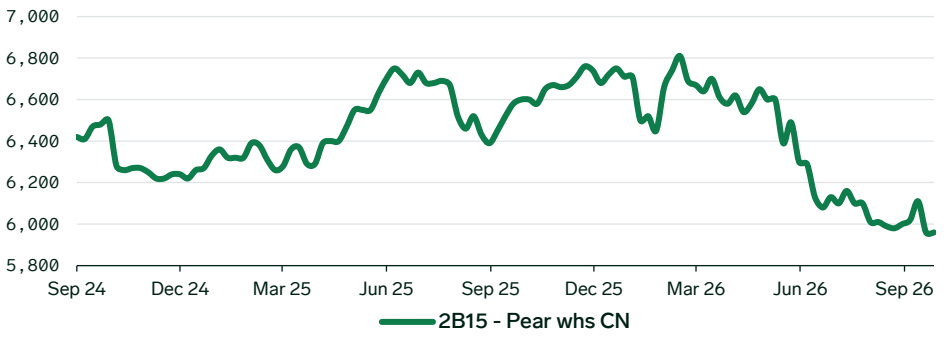

The average weekly price of Spanish Pear as of September 23 decreased by 7.2% MOM and declined by 10.2% YOY to €1,670/MT. This month, Spain's pear market remains challenging as the new season starts under heat-related pressure and weak commercial momentum. High summer temperatures are limiting fruit size and adding orchard-quality concerns, which is reducing the share of pears that meet preferred market specifications. Demand remains subdued, while overlap with Southern Hemisphere supply continues to weigh on early-season sales. As a result, more fruit is being placed into storage as exporters wait for better movement later in the campaign. Overall, the market remains cautious, with profitability tied to how quickly supply clears and whether autumn demand improves.

Pear Argentina - ARS/kg

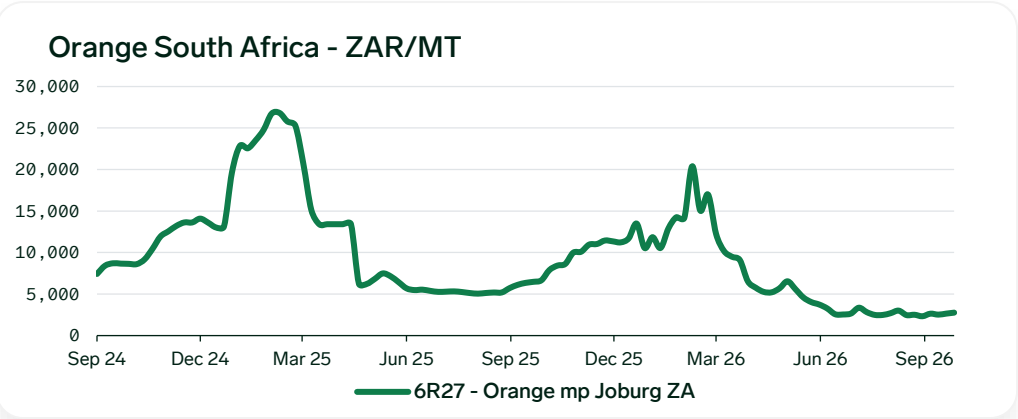

The average weekly price of Argentinian Pear as of September 2 was unchanged MOM and rose by 23.8% YOY to ARS 1,586.11/kg. This month, the Argentine pear market is being shaped by tighter export supply, export-readiness efforts, and a cautiously improving trade backdrop. A smaller crop has kept volumes lower, but the market has remained relatively orderly, with exporters focused on meeting phytosanitary and destination-market requirements. More broadly, Argentina's pear sector is benefiting from somewhat improved macro conditions and better trade sentiment, though competitiveness is still constrained by logistics costs, currency dynamics, and structural cost pressures. Overall, the market remains stable but commercially disciplined rather than expansive.

Pear China - CNY/MT

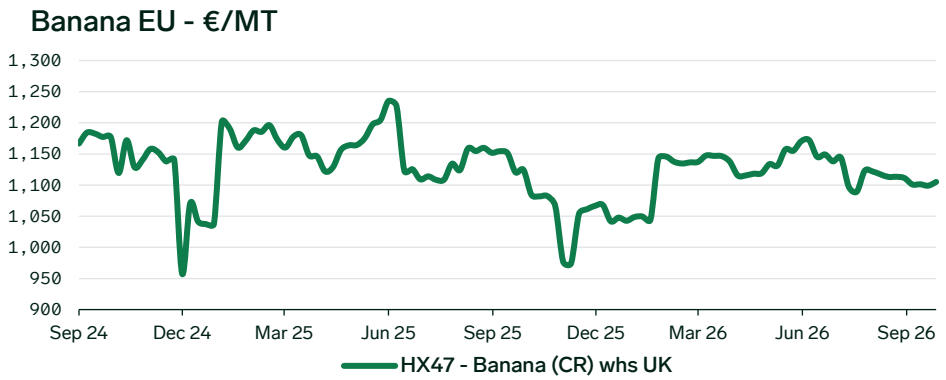

The average weekly price of Chinese Pear as of September 23 decreased by 0.5% MOM and declined by 8.6% YOY to CNY 5,960/MT. This month, China's pear market remains under pressure as new-season supply builds faster than demand. A larger, generally good-quality crop is weighing on prices, while buyers are purchasing cautiously and showing limited interest in building stocks. Domestic consumption remains subdued, and exporters are also facing a more competitive environment shaped by shifting overseas demand, policy uncertainty, and logistics costs. Market sentiment across fresh produce remains cautious, with ample supply putting pressure on returns. As a result, more fruit may be held in storage, which could prolong supply pressure later in the marketing season if demand does not strengthen.

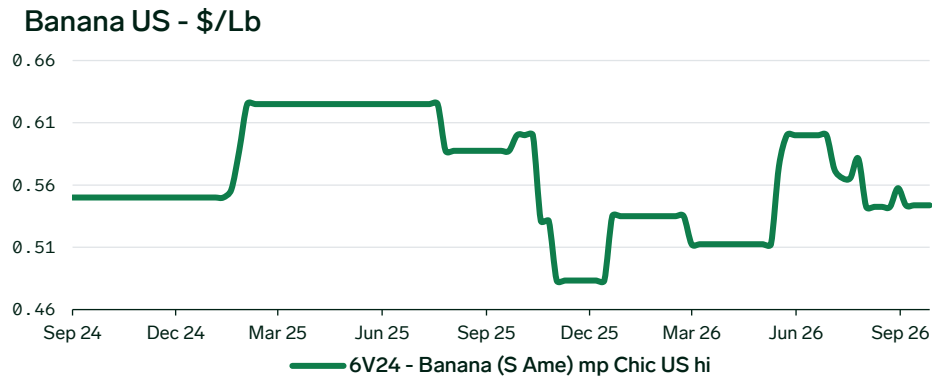

Oranges

The average weekly price of South African Orange as of September 30 increased by 10.1% MOM and declined by 57.3% YOY to ZAR 2,763.65/MT. Market sources report that a lack of access to the Middle East region, owing to the ongoing conflict and an associated increase in shipping rates, has inhibited export volumes to the key market, which usually accounts for about 20% of South African citrus exports. This has contributed to a buildup of domestic supply.

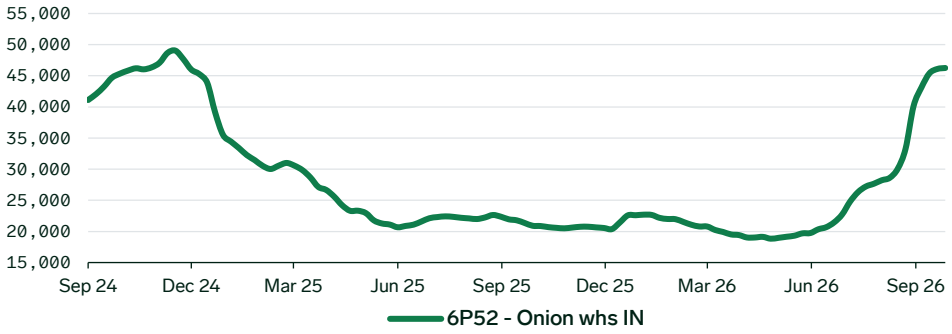

The average weekly price of EU Banana as of September 16 decreased by 1.4% MOM and declined by 4.6% YOY to €1,101.22/MT. Market sources report that weather and disease pressures continue to weigh on Costa Rican supply, following heavy rainfall in recent months that left some plantations submerged. Industry reports suggest that the production impact would become clearer in the coming months, with flooding also raising disease pressure concerns.

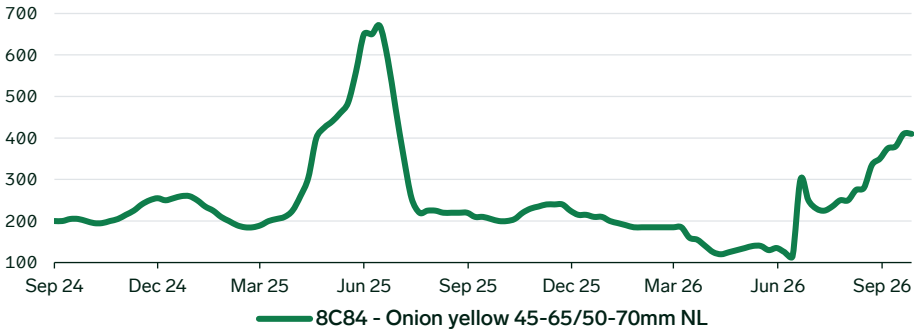

The average weekly price of US Banana as of September 30 increased by 0.2% MOM and declined by 7.4% YOY to $0.54/Lb. The US banana market remains one of the steadiest fruit categories this month, with supply generally stable and no major weather-related disruption affecting current availability. Market movement is limited relative to berries and mango, and buyers continue to view bananas as a predictable coverage item rather than an active risk position. Organic supply remains firmer than conventional but is still considered manageable. Some participants noted expanding capacity, which supports overall market stability. While emerging origins may create future competitive shifts, no material disruption is evident now. Overall pricing tone is steady to slightly variable.

Onion India - INR/MT

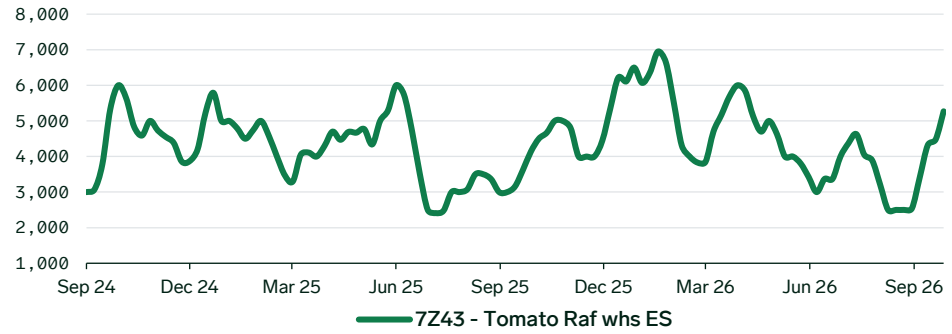

The average weekly price of Indian Onion as of September 30 increased by 38.8% MOM and rose by 116.5% YOY to INR 46,245.58/MT. Prices increased significantly throughout Q3, with market sources reporting significant storage losses. Unseasonal rain during the rabi harvest raised moisture content in the bulbs, and subsequent heat and humidity in June-July accelerated spoilage in stored stock. Some estimates put losses as high as 30-40% of stored rabi product. In addition, the kharif crop is reportedly delayed, due to late rainfall.

Onion EU - €/MT

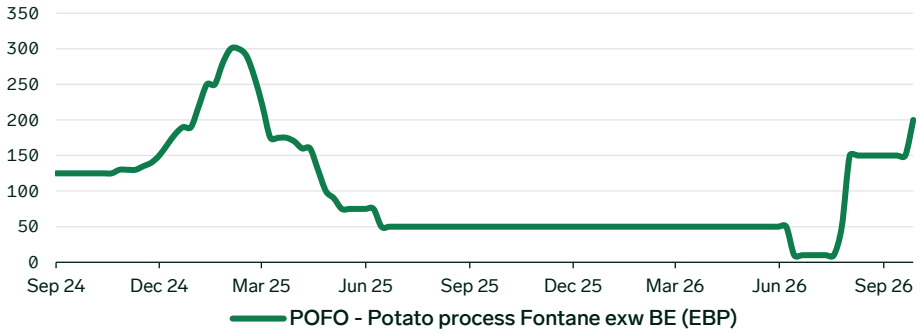

The average weekly price of EU Onion as of September 30 increased by 22.4% MOM and rose by 100.0% YOY to €410/MT. Market sources report supply issues for the 2026/27 season, though primarily in terms of product sizing rather than overall yield. As a result of the heatwave events that hit Europe over the summer, lack of rain inhibited bulb growth. The availability of larger sized stocks is reportedly significantly below normal levels.

Tomato EU - €/MT

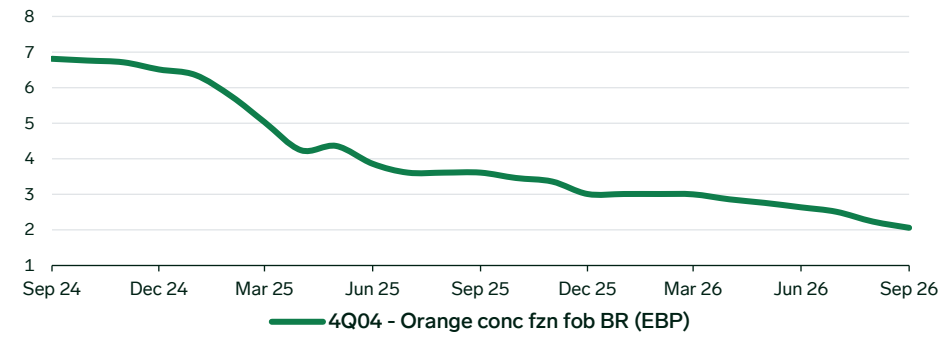

The average weekly price of EU Tomato as of September 30 increased by 110.8% MOM and rose by 45.3% YOY to €5,270/MT. Market sources suggest that supply is currently limited, while the industry continues to struggle with disease and pest challenges. Market sources report that a mite outbreak is being driven by recent high temperatures and low humidity and suggest that the prohibition of adequate insecticide varieties is compounding the issue.

Potato processing EU - €/MT

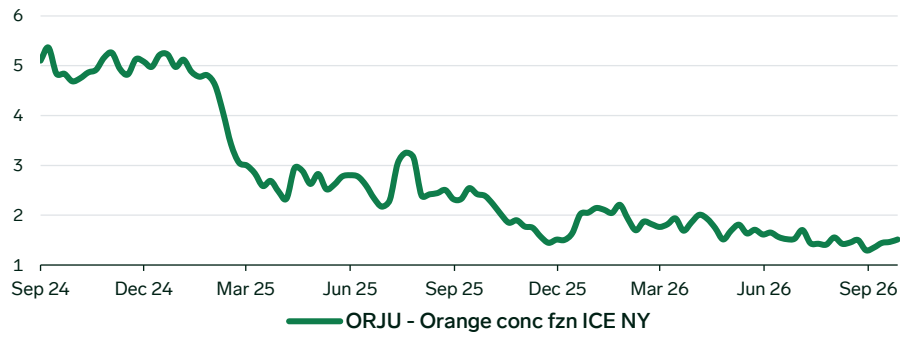

The average weekly price of EU Potato processing as of September 30 increased by 33.3% MOM and rose by 300.0% YOY to €200/MT. Although free-buy demand is low while market activity largely remains focused on contracts, supply is tight and remains a key concern for the outlook for the season. Market players suggest that there is some improvement in outlook, as some test liftings have produced better than expected yield improvements. However, despite this, they maintain that the 2026/27 yield will remain "very poor". The North-Western European Potato Growers (NEPG) association suggests that some growers may struggle to meet contracted volumes this season.

Orange Juice Brazil - $/kg

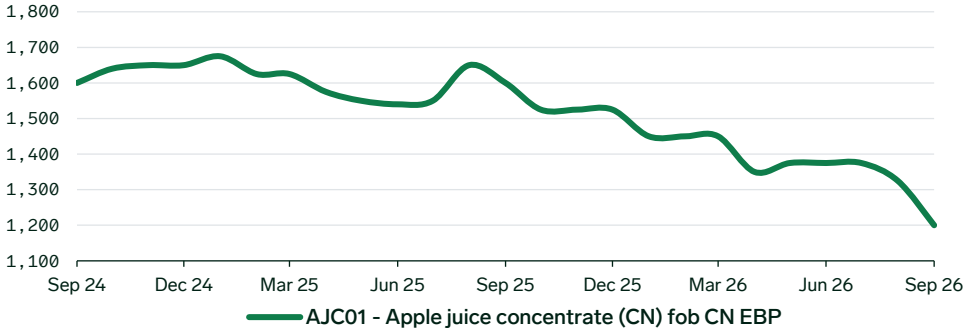

In September, the average price of Brazilian Orange Juice decreased by 7.8% MOM and declined by 42.9% YOY to $2.06/kg. Market sources report a challenging outlook driven by stubbornly low demand that continues to weigh on prices and is outpacing upward pressure from an anticipated crop reduction. Sources note that the market continues to soften, with some participants reporting a substantial dip in sales.

Orange Juice US - $/Lb

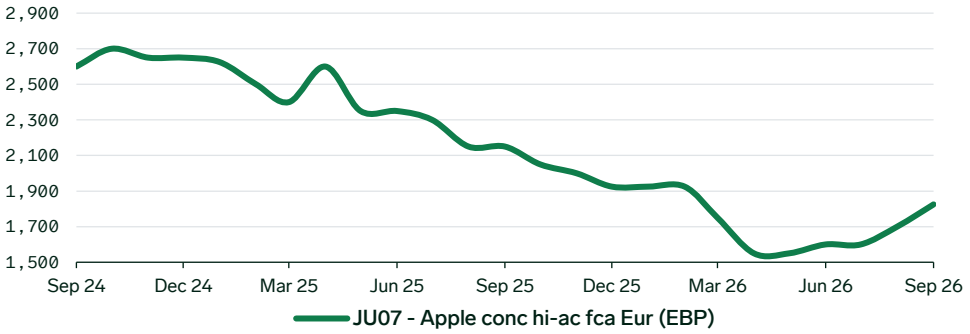

The average weekly price of US Orange Juice as of September 30 increased by 0.8% MOM and declined by 37.6% YOY to $1.51/Lb. Market players await the publication of the USDA's opening projection for Florida's 2026/27 orange harvest, due in October. As with the Brazilian market, sources highlighted sluggish demand as a major issue weighing on sentiment. Participants blame elevated pricing at the retail level as well as high inventories of FCOJ that continue to weigh on the market.

Apple Juice China - $/MT

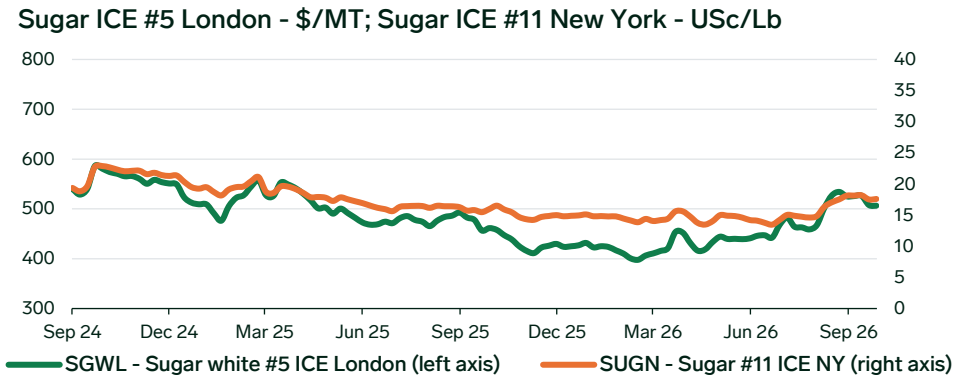

In September, the average price of Chinese Apple Juice decreased by 9.4% MOM and declined by 25.0% YOY to $1,200/MT. Raw material pricing is reportedly down YOY, enabling China to offer competitive pricing for AJC, and as such market sources suggest that Chinese product will remain a challenge for European producers this season.

Apple Juice EU - €/MT

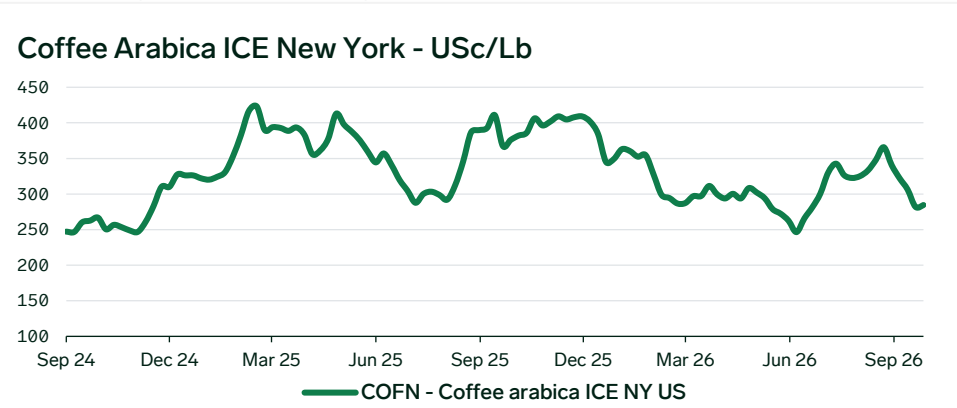

The average weekly price of EU Apple Juice as of September 30 increased by 7.4% MOM and declined by 15.1% YOY to €1,825/MT. Crop volumes in Poland remain a source of uncertainty. The World Apple and Pear Association's 2026/27 forecast anticipates Polish volumes at 2.67 million MT, down by 29.9% YOY and 27.1% below its three-year average. However, some market players dispute this, suggesting that the actual figure is more likely to reach 3.0-3.3 million MT. Despite this, raw material in Poland reportedly remains expensive compared with Turkey.

The average weekly spot price of ICE #11 Raw Sugar Futures as of September 30 increased by 0.4% MOM and rose by 13.7% YOY to USc 17.60/Lb.

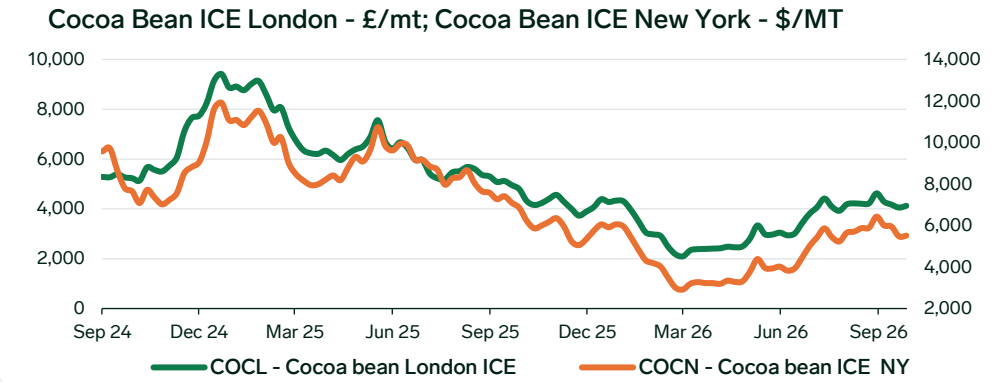

The average weekly spot price of ICE London #5 White Sugar futures as of September 30 decreased by 5.2% MOM and rose by 10.9% YOY to $506.48/MT.

Front-month raw sugar prices surpassed the USc 18.00/lb threshold and reached a 17-month high during the second week of September before profit-taking triggered a market correction. As a result, front-month ICE #11 October 2026 raw sugar futures declined by 1.0% MOM, closing September at USc 17.63/lb. Overall, sugar price movements continued to be primarily driven by weather developments and forecast updates.

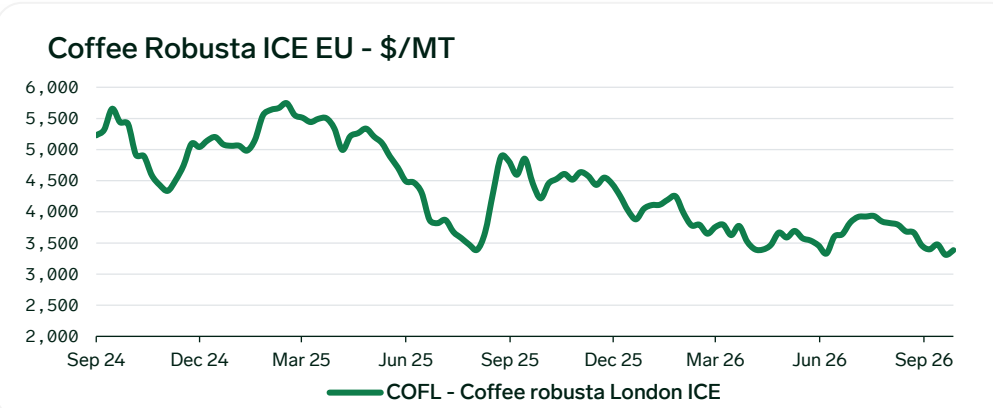

The average weekly price of ICE New York Arabica as of September 30 decreased by 22.2% MOM and declined by 22.6% YOY to USc 284.57/Lb.

Arabica prices in September fell significantly, as earlier uncertainty in July and August around the pace of Brazilian arabica exports eased. Throughout September, Brazilian exports accelerated and by the end of the month, Brazil was on track for record September coffee exports, according to market sources. As the market started to see the expected supply arriving, prices eased. Furthermore, Brazil started to receive rainfall, aiding flowering for next year's crop, reducing some of the weather risk premium that had supported prices earlier on in the year.

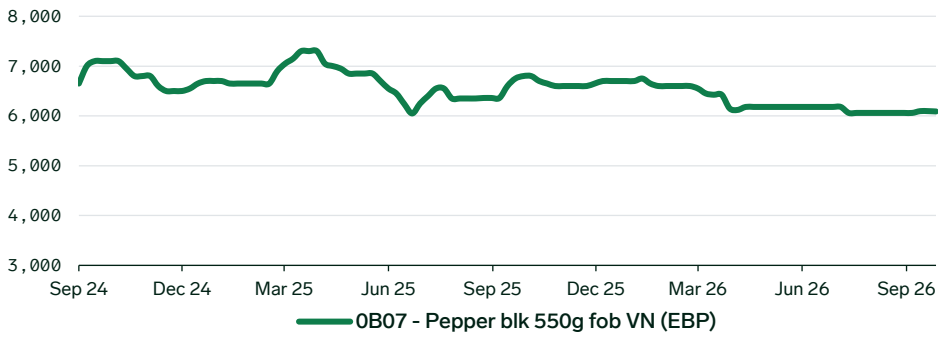

The average weekly price of London Cocoa Bean as of September 30 decreased by 2.3% MOM and declined by 16.8% YOY to £4,125.20/MT. The average weekly price of New York Cocoa Bean as of September 30 decreased by 6.4% MOM and declined by 22.3% YOY to $5,514.60/MT. Cocoa prices in both London and New York fell sharply throughout September, recovering slightly in the last week of the month before giving up most of those gains on the 30th. By September, market sources were increasingly confident that cocoa supplies were going to be more plentiful following the tight conditions of the prior season. Furthermore, strong Ivory Coast arrivals reinforced the supply story and bearish price direction.

The average weekly price of ICE London Robusta futures as of September 30 decreased by 7.7% MOM and declined by 24.1% YOY to $3,384.20/MT.

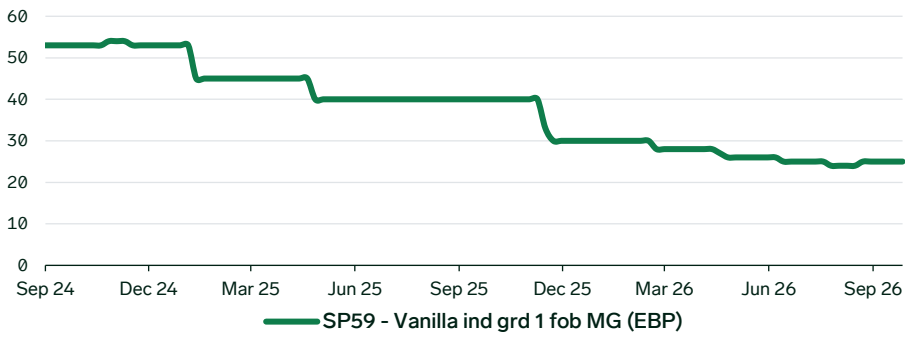

Robusta prices continued to ease as by the end of September ICE robusta inventories had risen to a 10-month high, increasing confidence that nearby supply was becoming even more readily available than last month. September is also usually a bearish month for robusta as Vietnam's 2026/27 harvest begins at the end of September.

Black Pepper Vietnam - $/MT

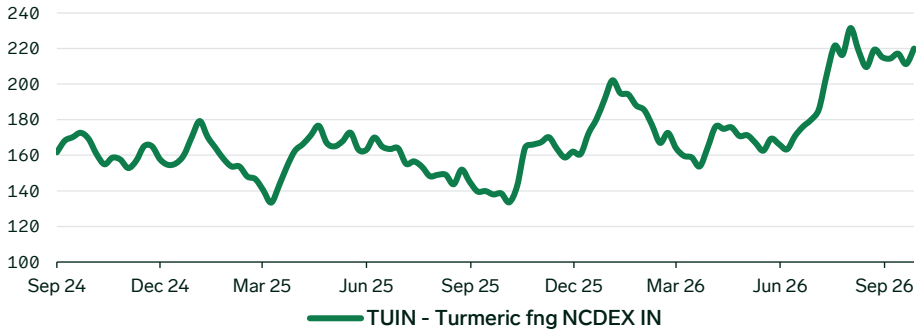

The average weekly price of Vietnamese Black Pepper as of September 30 increased by 0.5% MOM and declined by 9.8% YOY to $6,089/MT.

Vanilla Madagascar - $/kg

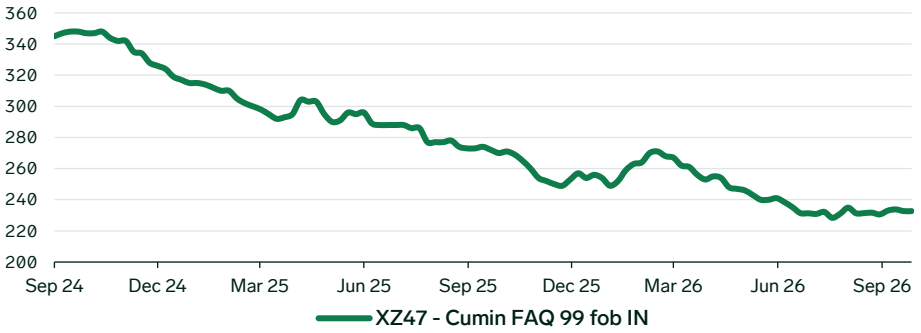

The Expana Benchmark Prices (EBP) of vanilla from Madagascar, the world's largest producer, were steady MOM in September, down 37.5% YOY, at $25/kg for industrial grade 1 extraction vanilla beans. The export season closed in August, with roughly around 3,800 MT of vanilla reportedly exported from Madagascar during 2025/26.

Turmeric India - $/100kg

The average weekly price of Indian Turmeric as of September 30 increased by 0.3% MOM and rose by 59.4% YOY to $219.99/100kg.

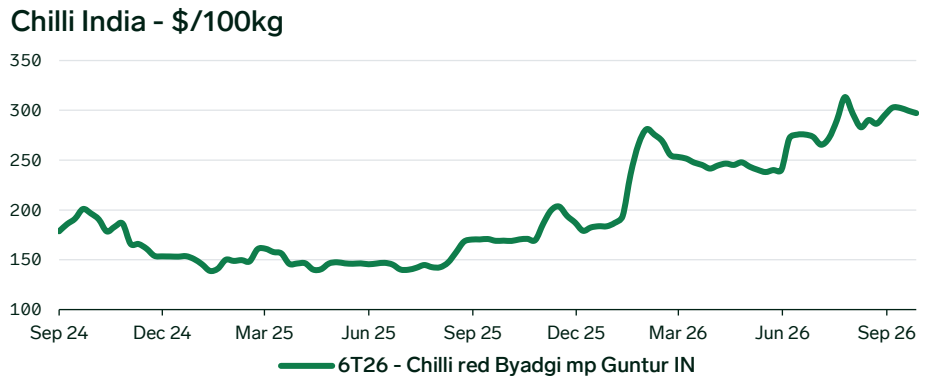

Cumin India - $/100kg

The average weekly price of Indian Cumin as of September 30 increased by 0.4% MOM and declined by 14.4% YOY to $232.70/100kg.

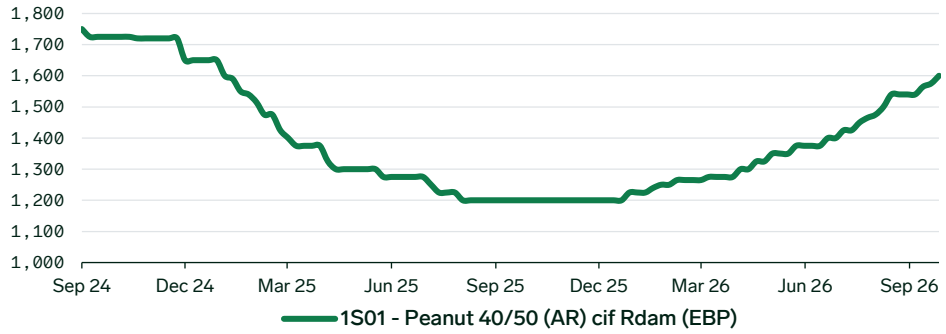

Herbs & Spices

Chilli

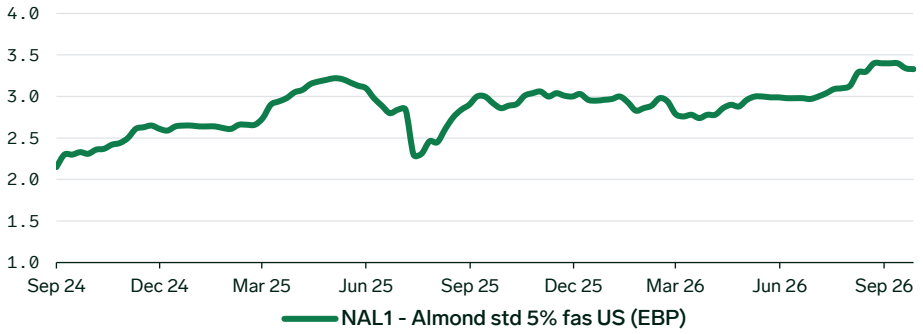

The average weekly price of Indian Chilli as of September 30 increased by 3.7% MOM and rose by 75.8% YOY to $297.18/100kg.

Peanuts Argentina - $/MT

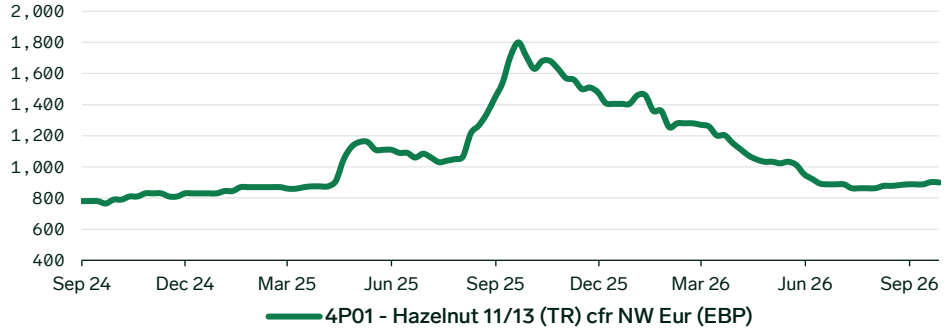

The average weekly price of Argentinian Peanuts as of September 30 increased by 3.9% MOM and rose by 33.3% YOY to $1,600/MT. Argentine peanuts continued their climb through September, supported by the smaller crop and materialization of quality concerns flagged earlier in the season. As processing of newly harvested supply progressed, damage and quality issues continued to narrow the proportion meeting EU specifications, sources indicate. Sellers have found themselves more strongly sold than anticipated and are exercising caution with remaining inventories. Higher costs across production, processing, and freight have added further support to prices.

Almonds US - $/Lb

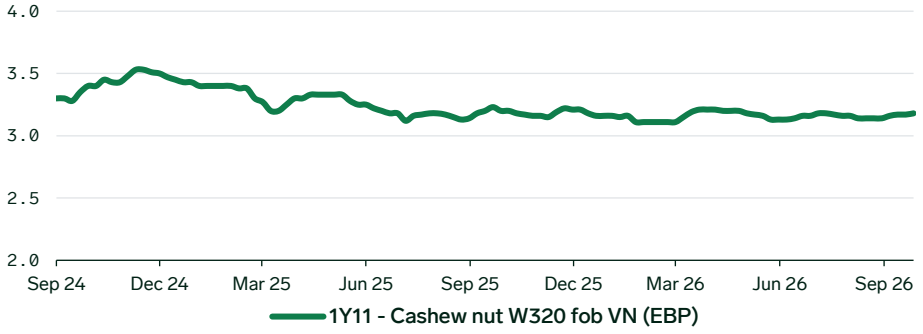

The average weekly price of US Almonds as of September 30 decreased by 2.1% MOM and rose by 14.0% YOY to $3.33/Lb. US almond prices eased slightly through September amid increased liquidity entering the market. Tight stocks through the crop-year transition combined with uncertainty about incoming volumes had kept sellers cautious, resulting in significant price increases earlier in the transition. As harvest progress improved seller comfort levels, market participants became more willing to sell even as sentiment continues to suggest the crop may prove smaller than initial expectations. Despite the recent softening, prices remain near multi-year highs, and market players view downside risk as limited.

Hazelnuts Turkey - $/100kg

The average weekly price of Turkish Hazelnuts increased by 1.9% MOM in September and declined by 50% YOY to $900/100kg. The International Nut and Dried Fruit Council (INC) projects the 2026/27 Turkish hazelnut crop at 809,940 MT, an official estimate that would mark a 56% rebound from the depressed 518,000 MT harvested in 2025/26. Industry expectations, however, appear to have shifted lower. Rainfall in the Eastern Black Sea region delayed harvest this year, and quality concerns, including stink bug damage and a higher incidence of blank nuts, have prompted growing doubt that the crop will reach the INC figure. A number of market sources now expect the crop to land closer to 700,000 MT.

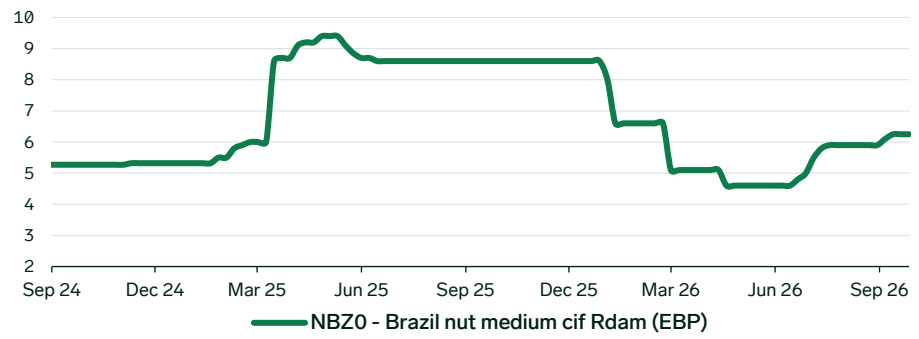

Cashews Vietnam - $/Lb

The Vietnamese cashew nut EBP for WW320 increased by 1.3% MOM in September and fell by 1.5% YOY to $3.18/Lb. Kernel prices continue to find support from persistent firmness in the RCN market, while larger grades have strengthened further amid tight availability and steady demand. Following a quiet August and a subdued first half of September, demand picked up in the latter part of the month as buyers in the EU and US returned to cover positions for H1 2027.

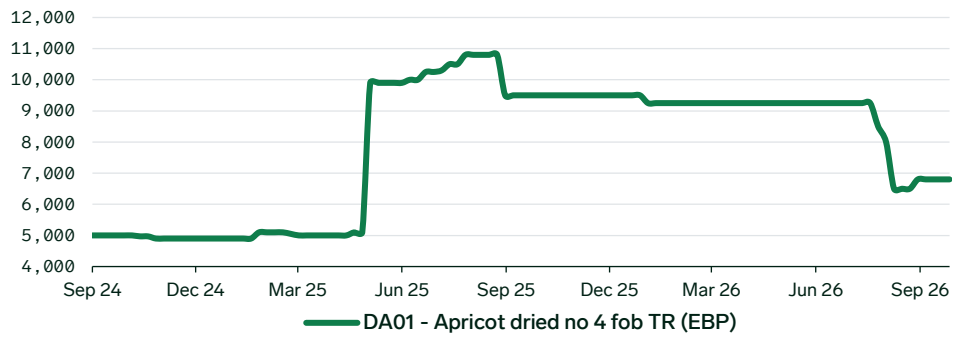

Brazil nuts, dried apricot & sultanas

Brazil Nuts South America - $/Lb

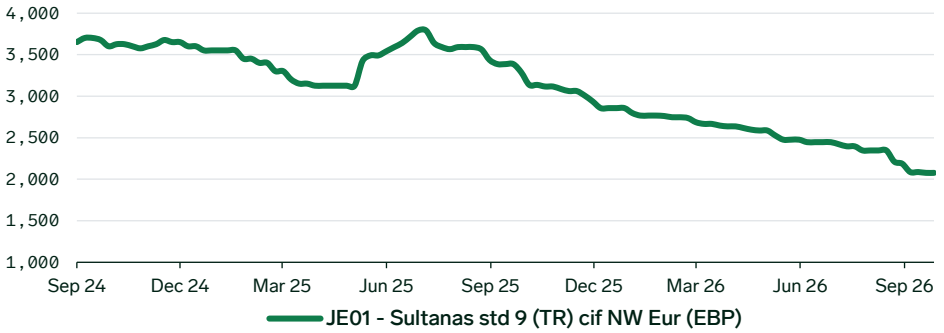

The Brazil nut EBP rose by 5.9% MOM in September to $6.25/Lb, down 27.3% YOY. The season in Bolivia has now ended, with most material already sold out by processors.

Dried Apricots Turkey - $/MT

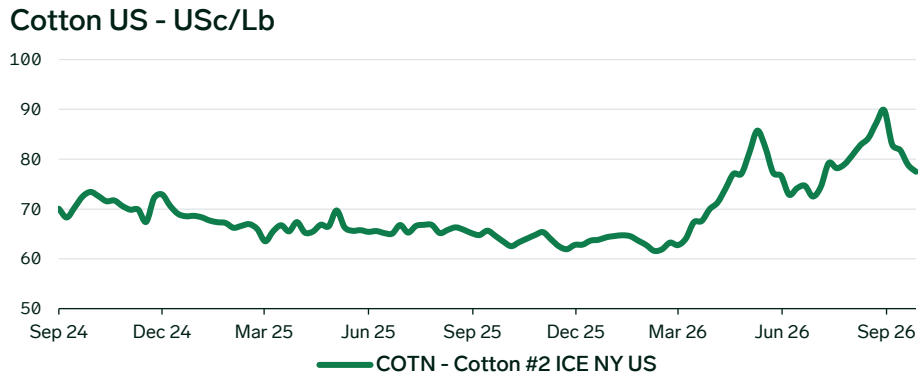

Turkish dried apricot prices rose by 4.6% MOM in September to $6,800/MT, down 28.4% YOY. Prices corrected upward as demand returned, mainly for smaller sizes and diced apricots. Nonetheless, prices remain below last year's levels as Turkey's supply situation improves following a decent harvest this year.

Sultanas Turkey - $/MT

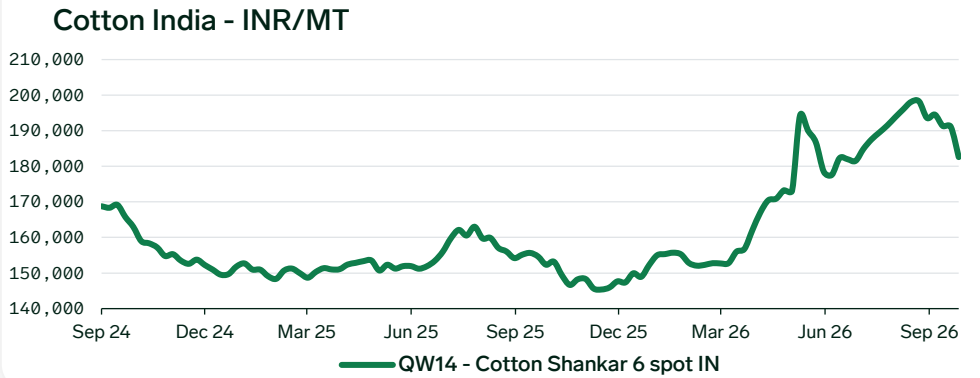

The average weekly price of Turkish sultanas decreased by 6.1% MOM in September, down 38.7% YOY to $2,077/MT. Turkey's 2026/27 sultana harvest has finished, bringing a large crop after three difficult years of poor harvests. Growing conditions in western Turkey were good throughout the season, with hot and sunny weather helping the harvest and drying process. This recovery marks a return to normal supply levels after a challenging period for the market. The Aegean Exporters' Association published the Official Sultanas Size Declaration for Crop 2026, formally downgrading berry-count specifications across all grades—standard sultanas now 261-350 berries/100g (from 201–260).

Cotton

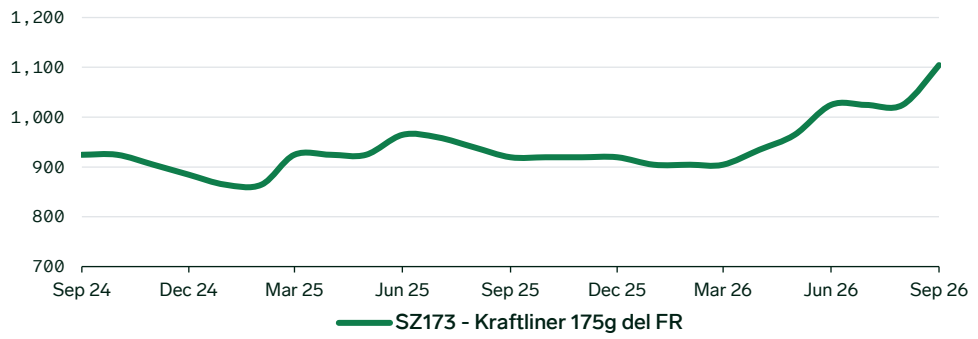

The average weekly price of US Cotton as of September 30 decreased by 11.2% MOM and rose by 19.9% YOY to USc 77.48/Lb. According to sources, the MOM decline was attributable to new crop hitting the market as harvest got underway during the month. The harvest supply outweighed the drought and crop quality concerns that had driven prices upwards throughout August.

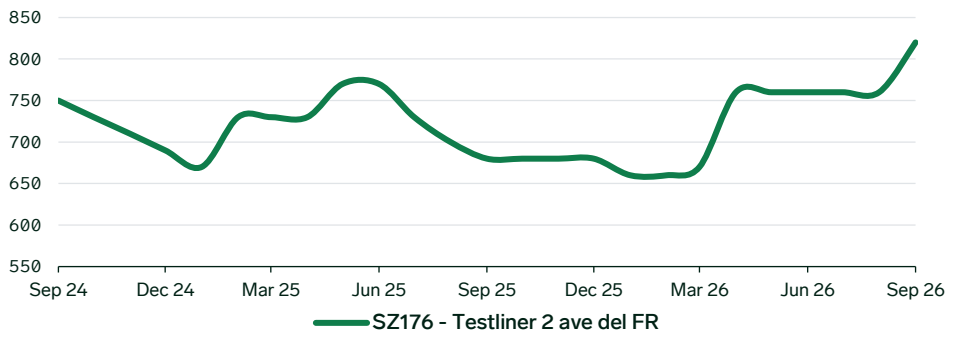

The average weekly price of Indian Cotton as of September 30 decreased by 7.9% MOM and rose by 18.1% YOY to INR 182,583.94/MT. Mill demand was reportedly stable MOM. Like in the US, new crop entered the market in September, with players expecting more arrivals throughout October. Furthermore, supply was bolstered by large carry-in stocks.

Kraftliner EU - €/MT

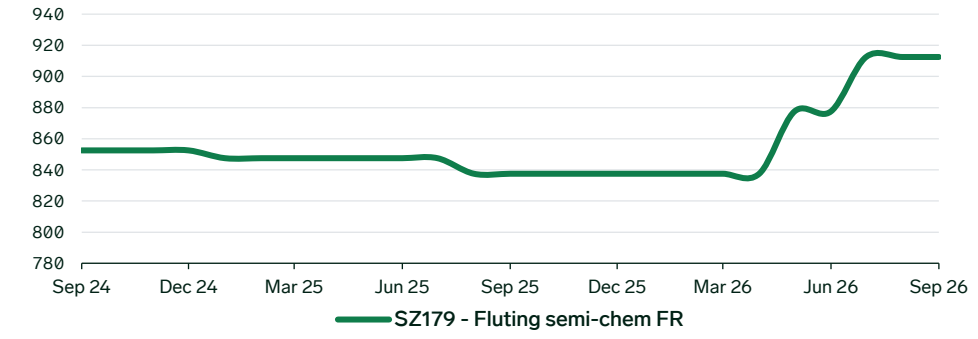

In September, the average price of EU Kraftliner increased by 7.8% MOM and rose by 20.1% YOY to €1,104.50/MT. Kraftliner suppliers raised prices against the backdrop of rising energy and logistics costs. Moreover, many producers announced further price increases for November. At the same time, raw materials costs did not change significantly in September, on the contrary, eucalyptus pulp prices continued to decline from the peaks reached in the summer months.

Testliner EU - €/MT

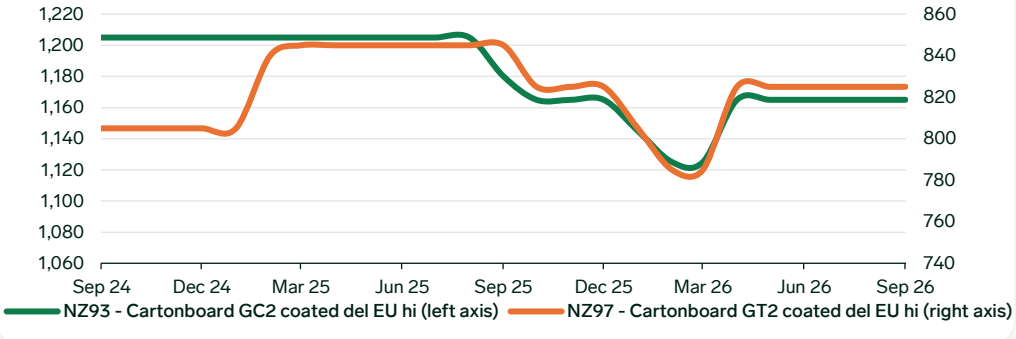

In September, the average price of EU Testliner increased by 7.9% MOM and rose by 20.6% YOY to €820/MT. Like kraftliner producers, testliner producers raised prices due to rising energy and logistics costs. Waste paper prices in the EU were generally stable, although in some markets sources pointed to weak price growth depending on grade. Sources pointed to strong demand and a high volume of orders for manufacturers.

Fluting EU - €/MT

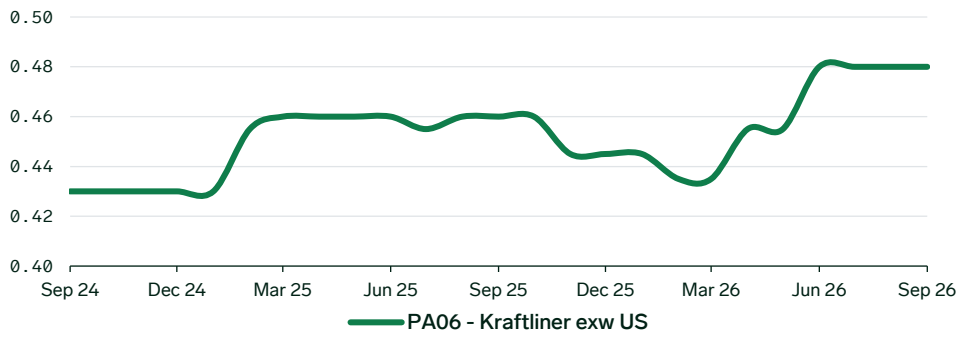

In September, the average price of EU Fluting was unchanged MOM and rose by 9.0% YOY to €912.50/MT. Despite stable prices, negotiations for semi-chemical fluting price increases continue. After testliner and kraftliner prices rose in September, market players pointed to intensifying pressure from suppliers.

Cartonboard EU - €/MT

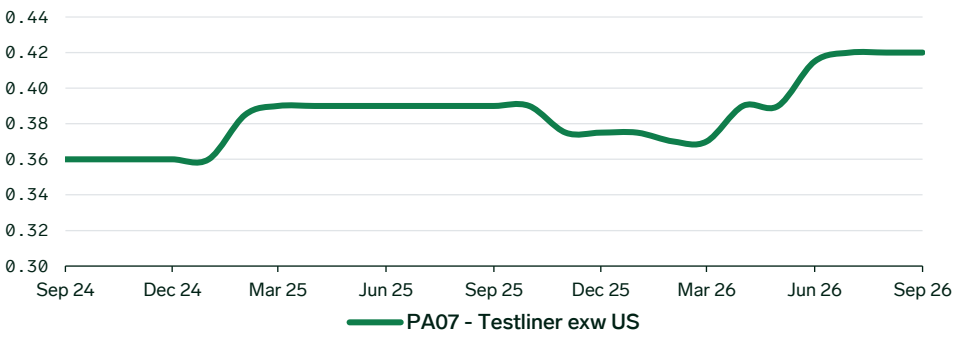

In September, the average price of EU Cartonboard GC2 was unchanged MOM and declined by 1.3% YOY to €1,165/MT. In September, the average price of EU Cartonboard GT2 was unchanged MOM and declined by 2.4% YOY to €825/MT. Nevertheless, some suppliers have already announced price increases for October citing high energy costs. Sources indicate that key negotiations are focused on pricing for the winter months as further increases in energy prices are expected. At the same time, demand in the market was fairly weak in September.

Linerboard US - $/Lb

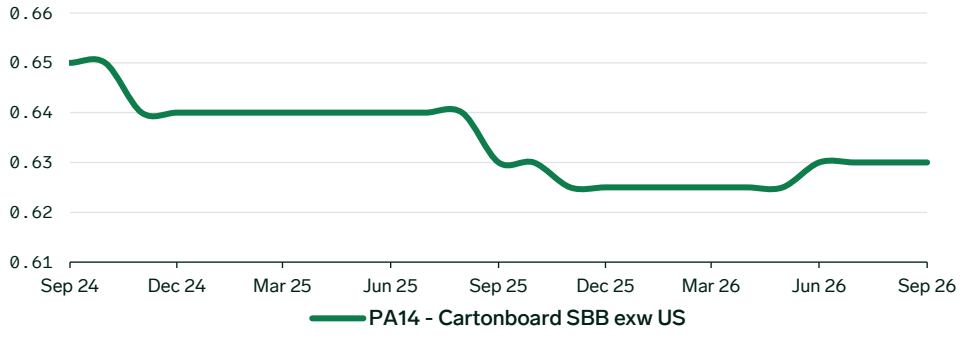

In September, the average price of US Linerboard was unchanged MOM and rose by 4.3% YOY to $0.48/Lb. Kraftliner held at $1,058/MT in September, up 4% year on year, as producers launched a third 2026 round of increases of $80–140/ton. Independent converters disputed the hikes and buyers reported ample supply, so little of the increase reached open-market contracts.

Testliner US - $/Lb

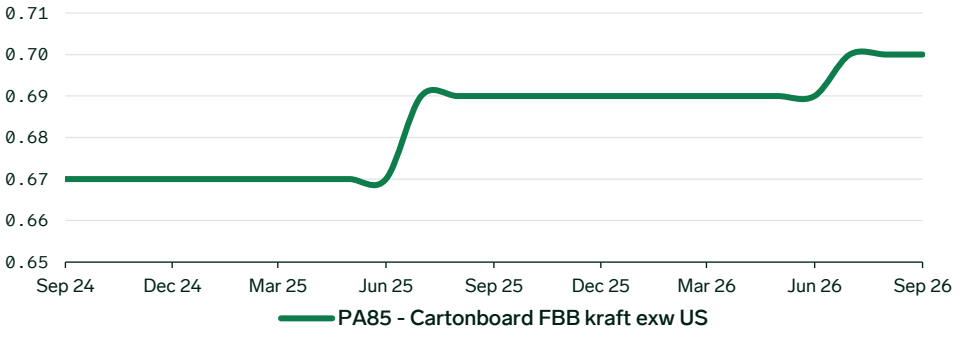

In September, the average price of US Testliner was unchanged MOM and rose by 7.7% YOY to $0.42/Lb. US testliner ex-works prices held at $926/MT in September, a 52-week high and 8% above a year earlier. The spread to kraftliner stayed at $132/MT, down from $154/MT a year earlier, as recycled grades outpaced virgin liner over the past twelve months. Recycled mills got some relief on fiber: OCC fell to $107/MT in September from $111/MT in August.

Cartonboard SBB US - $/Lb

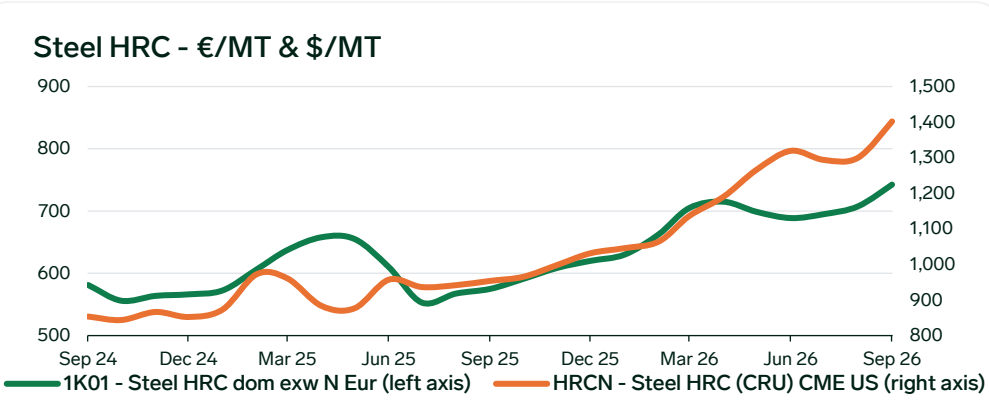

In September, the average price of US Cartonboard SBB was unchanged MOM and YOY to $0.63/Lb. SBB held at $1,389/MT and FBB at $1,543/MT in September, despite 4–6% increases that SBS producers announced for August. Greif will shut its Sweetwater recycled board mill in Georgia by year-end (about 120,000 tons a year), adding to 2026 cuts at Cypress Bend and La Tuque.

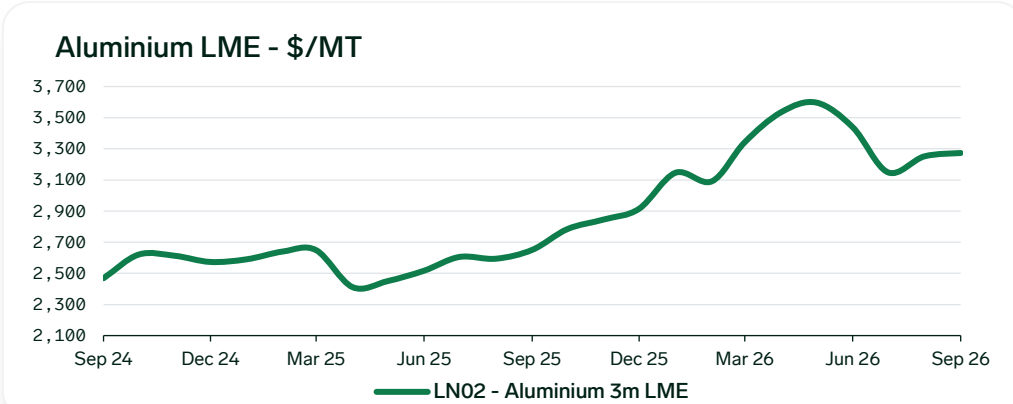

Cartonboard FBB US - $/Lb

In September, the average price of US Cartonboard FBB was unchanged MOM and rose by 1.4% YOY to $0.70/Lb. In Europe, higher energy costs have led cartonboard makers to announce increases, including €89/t from Sappi effective November 1.

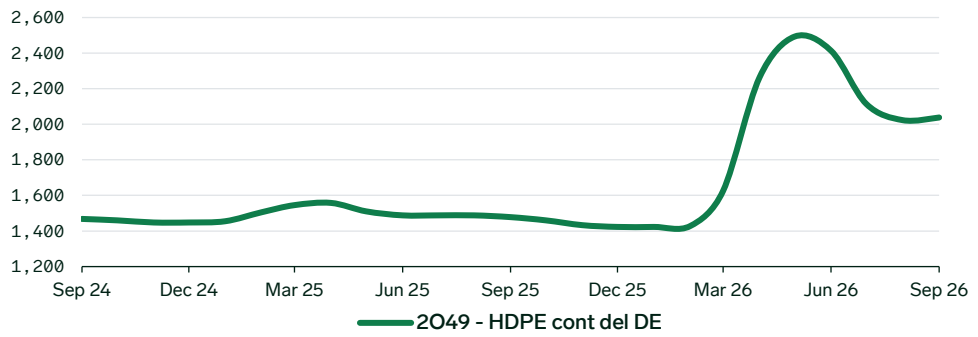

In September, the average 3-month (3m) futures price of US HRC steel at CME increased by 7.9% MOM and rose by 47.0% YOY to $1,401.92/MT. In September, the average price of EU Steel increased by 4.9% MOM and rose by 29.1% YOY to €742.50/MT. HRC prices in Europe rose again exceeding the previous 2026 high reached in April. We also note that HRC prices have now reached a three-year high. Market sources in Europe point to import restrictions introduced in 2026 as the main driver of price growth. In the US, HRC prices also continued to rise in September, supported by tariff policy on imports.

In September, the average 3m futures price of LME Aluminium increased by 0.7% MOM and rose by 23.5% YOY to $3,272.89/MT. The metals market was balanced according to players due to a decline in speculative activity. Rising aluminum metals exports from China and gradual increase in aluminum metals exports from Persian Gulf countries allowed supply to increase. At the same time, demand for aluminum metals continues to be high.

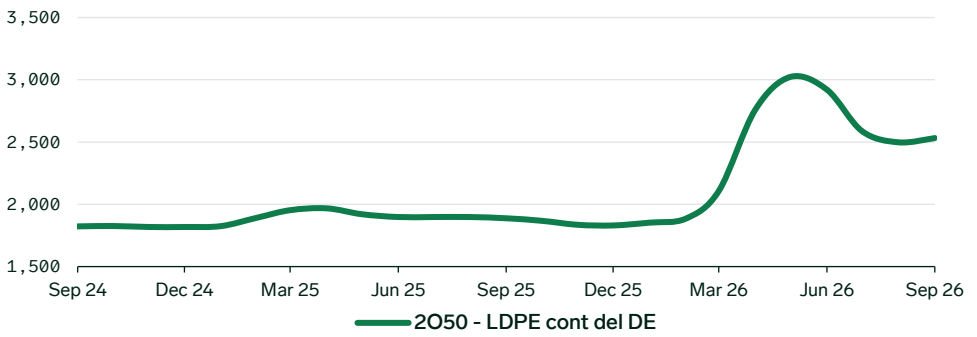

Expana

HDPE EU - €/MT

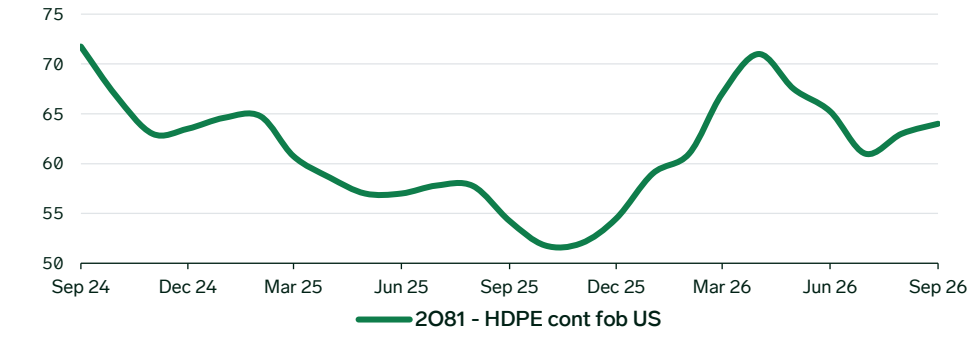

In September, the average price of EU HDPE increased by 0.7% MOM and rose by 37.9% YOY to €2,038/MT. Despite the three-month retreat, the polyolefins (HDPE, LDPE, PP) remain well above year-ago levels. The recent correction reflects growing buyer resistance after the spring price surge, compounded by a seasonal downstream slowdown.

LDPE EU - €/MT

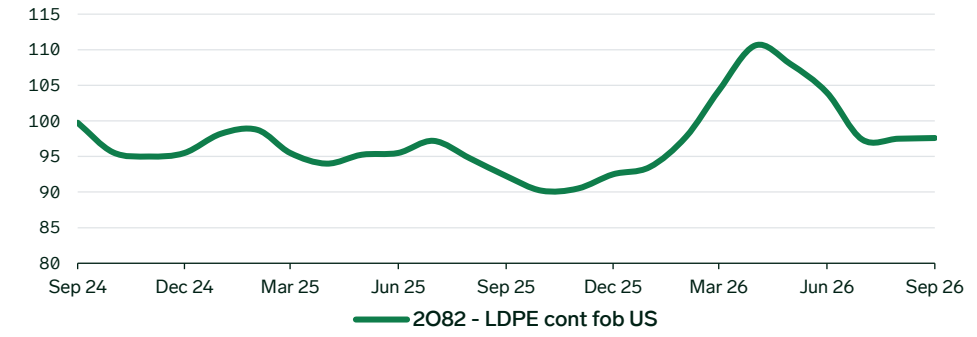

In September, the average price of EU LDPE increased by 1.4% MOM and rose by 34.1% YOY to €2,532/MT. Most converters have been purchasing only near-term requirements, and the reopening of arbitrage, led by China's return to export markets, has begun to reshape global trade flows and pressure European offers.

HDPE US - USc/Lb

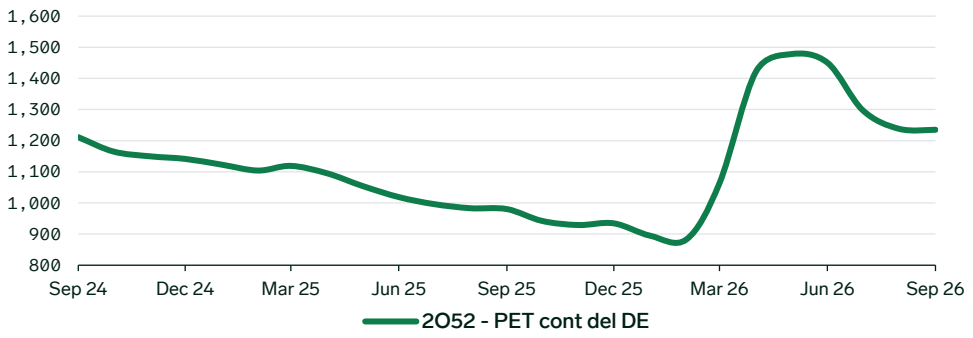

In September, the average price of US HDPE increased by 1.6% MOM and rose by 18.0% YOY to USc 64/Lb. PE contract prices ticked higher in August, breaking a three-month slide from the April peak. HDPE posted the largest move among the polyolefins. •The uptick came despite comfortable domestic inventories and was supported in part by stronger export demand and a late-month crude oil rally tied to renewed Middle East tensions.

LDPE US - USc/Lb

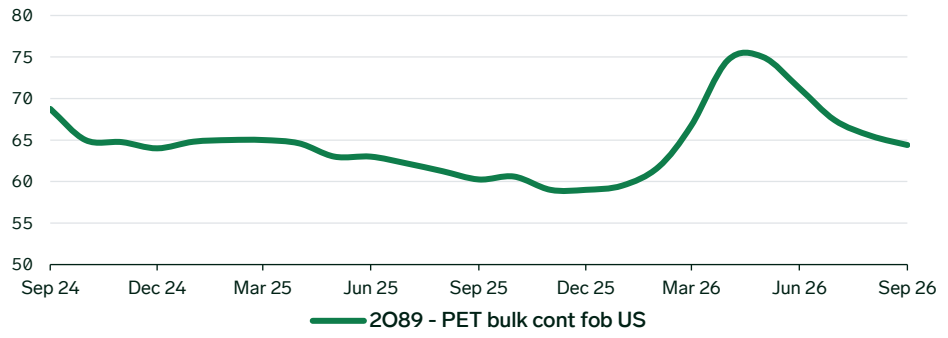

In September, the average price of US LDPE increased by 0.1% MOM and rose by 5.8% YOY to USc 97.60/Lb. LDPE edged up more modestly in September, with most of the gains resulting due to increases in export demand, according to sources.

PET EU - €/MT

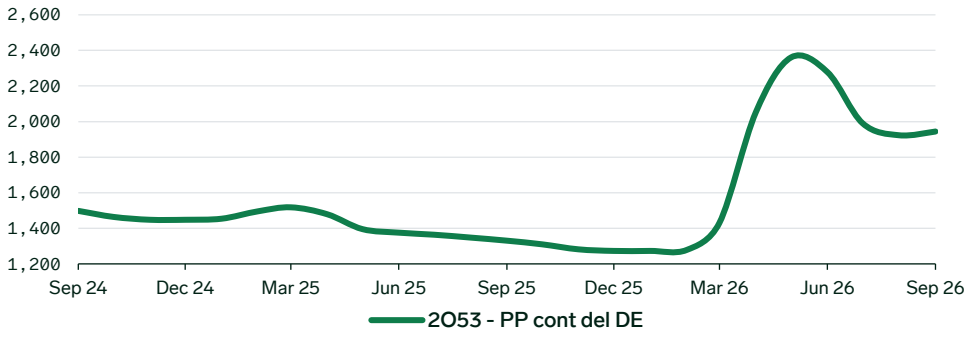

In September, the average price of EU PET decreased by 0.2% MOM and rose by 26.0% YOY to €1,235/MT. PET and PVC have seen more modest YOY gains, suggesting the Hormuz supply shock hit polyolefin feedstock chains hardest.

PET US - USc/Lb

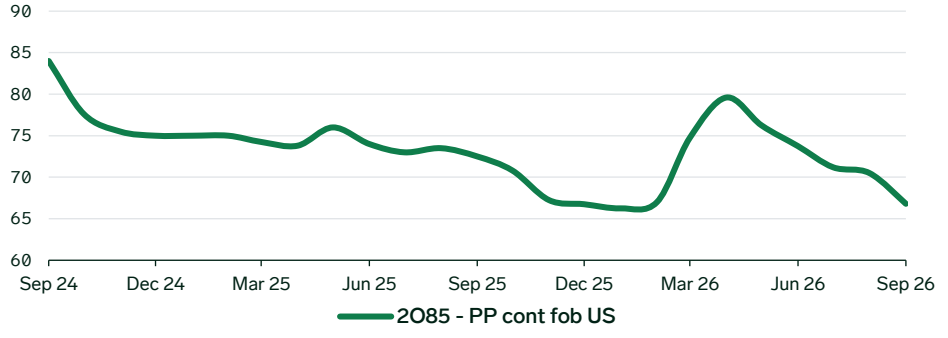

In September, the average price of US PET decreased by 1.7% MOM and rose by 6.9% YOY to USc 64.40/Lb. PET and PVC extended softer trends driven by measured downstream purchasing and ample supply.

PP EU - €/MT

In September, the average price of EU PP increased by 1.1% MOM and rose by 46.1% YOY to €1,944/MT. After months of sluggish demand, ample supplies, and relentless price erosion, some sellers are seizing on higher feedstock costs to argue the market has reached its bottom, though buyers have largely pushed back on that framing.

PP US - USc/Lb

In September, the average price of US PP decreased by 5.2% MOM and declined by 7.9% YOY to USc 66.80/Lb. PP was pulled lower by declining PGP feedstock costs. The market has not weakened in a disorderly way, but domestic buying remains patient, with processors purchasing to cover near-term needs rather than building inventory.
